

RX Family

TSIP (Trusted Secure IP) Module Firmware Integration Technology (Binary version)

Introduction

This document explains the usage of the software drivers for the Trusted Secure IP (TSIP) and TSIP-Lite modules on RX Family microcontrollers (MCUs). These software drivers are referred to collectively as the TSIP driver.

The TSIP driver is provided as a Firmware Integration Technology (FIT) module. Refer to the webpage linked to below for an overview of FIT.

<https://www.renesas.com/jp/ja/products/software-tools/software-os-middleware-driver/software-package/fit.html>

The TSIP driver provides APIs for the cryptographic algorithms listed in Table 1 and Table 2 as well as for securely performing firmware updates.

Confirmed Devices

TSIP: RX65N and RX651 groups, RX671 group, RX72M group, and RX72N group

TSIP-Lite: RX231 group, RX23W group, RX26T group, RX66T group, and RX72T group

For the specific product numbers of MCUs with TSIP functionality, refer to the user's manuals of the respective RX MCUs.

There is an application note describing the details of the TSIP driver.

This application note will be explained using the key attached to the sample program. The key for mass production needs to be newly generated. An application note with the key details is available.

We will provide the product to customers who will be adopting or plan to adopt a Renesas microcontroller. Please contact your local Renesas Electronics sales office or distributor.

Table 1 TSIP Cryptographic Algorithms

Cipher Type		Algorithms
Asymmetric (public key) cryptography	Encryption/decryption	RSAES-PKCS1-v1_5 (1024-/2048-/3072-/4096-bit)* ¹ : RFC 8017
	Signature generation/verification	RSASSA-PKCS1-v1_5 (1024-/2048-/3072-/4096-bit)* ¹ : RFC 8017 ECDSA (ECC P-192/P-224/P-256/P-384): FIPS186-4
	Key generation	RSA (1024-/2048-bit) ECC P-192/P-224/P-256/P-384
Symmetric key cryptography	AES	AES (128-/256-bit) ECB/CBC/CTR: FIPS 197, SP800-38A
	DES	TDES (56-/56x2-/56x3-bit) ECB/CBC: FIPS 46-3
	ARC4	ARC4 (2048-bit)
Hashing	SHA	SHA-1, SHA-256: FIPS 180-4
	MD5	MD5: RFC 1321
Authenticated encryption with associated data (AEAD)		GCM/CCM: FIPS 197, SP800-38C, SP800-38D
Message authentication		CMAC (AES): FIPS 197, SP800-38B GMAC: RFC 4543 HMAC (SHA): RFC 2104
Pseudo-random bit generation		SP 800-90A
Random number generation		Tested with SP 800-22.
TLS	TLS 1.2	TLS 1.2: RFC 5246 Supported cipher suites (TLS 1.2): TLS_RSA_WITH_AES_128_CBC_SHA TLS_RSA_WITH_AES_256_CBC_SHA TLS_RSA_WITH_AES_128_CBC_SHA256 TLS_RSA_WITH_AES_256_CBC_SHA256 TLS_ECDHE_ECDSA_WITH_AES_128_CBC_SHA256 TLS_ECDHE_RSA_WITH_AES_128_CBC_SHA256 TLS_ECDHE_ECDSA_WITH_AES_128_GCM_SHA256 TLS_ECDHE_RSA_WITH_AES_128_GCM_SHA256
	TLS 1.3	TLS 1.3: RFC 8446 Supported cipher suites (TLS 1.3)* ² : TLS_AES_128_GCM_SHA256 TLS_AES_128_CCM_SHA256
Key update functions		AES, RSA, DES, ARC4, ECC, HMAC
Key exchange		ECDH P-256, ECDHE NIST P-512: SP800-56A, SP800-56C DH (2048-bit)
Key wrapping		AES (128-/256-bit)

Notes: 1. RSA (3072-/4096-bit) is supported for signature verification and modular exponentiation using public key only.

2. Applicable devices are the RX65N and RX651 groups, RX66N group, RX72M group, and RX72N group.

Table 2 TSIP-Lite Cryptographic Algorithms

Cipher Type		Algorithms
Symmetric key cryptography	AES	AES (128-/256-bit) ECB/CBC/CTR: FIPS 197, SP800-38A
Authenticated encryption with associated data (AEAD)		GCM/CCM: FIPS 197, SP800-38C, SP800-38D
Message authentication		CMAC (AES): FIPS 197, SP800-38B GMAC: RFC 4543
Pseudo-random bit generation		SP 800-90A
Random number generation		Tested with SP 800-22.
Key update functions		AES
Key wrapping		AES (128-/256-bit)

1. Overview

1.1 Terminology

Terms used in this document are defined below. Note that the names used for some keys differ from those used in the “Diagram of Key Installation Process” appearing in the Trusted Secure IP section of the hardware manual of the MCU. Refer to “Diagram of Key Installation Process” (reproduced below as Figure 1.1) alongside the list below.

Table 1-1 Descriptions of Terms

Term	Description	Correspondence with Diagram of Key Installation Process
Key injection	Injecting a wrapped key into the device at the factory.	—
Key updating	Injecting a wrapped key into the device in the field.	—
User key	An encryption key in plaintext used by the user. Not used on the device. For AES, DES, ARC4, and HMAC, user keys are used as shared keys. For RSA and ECC, user keys are used as public keys and secret keys.	Key-1
Encrypted key	Key information generated by adding a MAC value and encrypting a user key using a UFPK or update key. An encrypted key corresponding to the same user key is a shared value on each device.	eKey-1
Wrapped key	Data consisting of an encrypted key that has been converted into a form that is usable by the TSIP driver by key injection or key updating. The wrapped key has been wrapped using an HUK, so the wrapped key of the same encrypted key will be a unique value on each device.	Index-1 or Index-2
UFPK	User Factory Programming Key A keyring set by the user and used to generate an encrypted key from a user key during key injection. Not used on the device.	Key-2
W-UFPK	Wrapped UFPK Key information generated by wrapping a UFPK using an HRK on the DLM server. The UFPK is decrypted using the HRK internally by the TSIP.	Index-2
Key update key (KUK)	A key set by the user and used to generate an encrypted key from a user key during key updating. The wrapped KUK for the update key must be generated beforehand by key injection in order to perform key updating on the device.	—
Hidden root key (HRK)	A shared encryption key that exists only inside the TSIP and in secure rooms within Renesas.	—
Hardware unique key (HUK)	A device-specific encryption key that is derived internally by the TSIP and used to protect key data.	—
Device Lifecycle Management (DLM) server	A key management server operated by Renesas. It is used for wrapping UFPK.	—

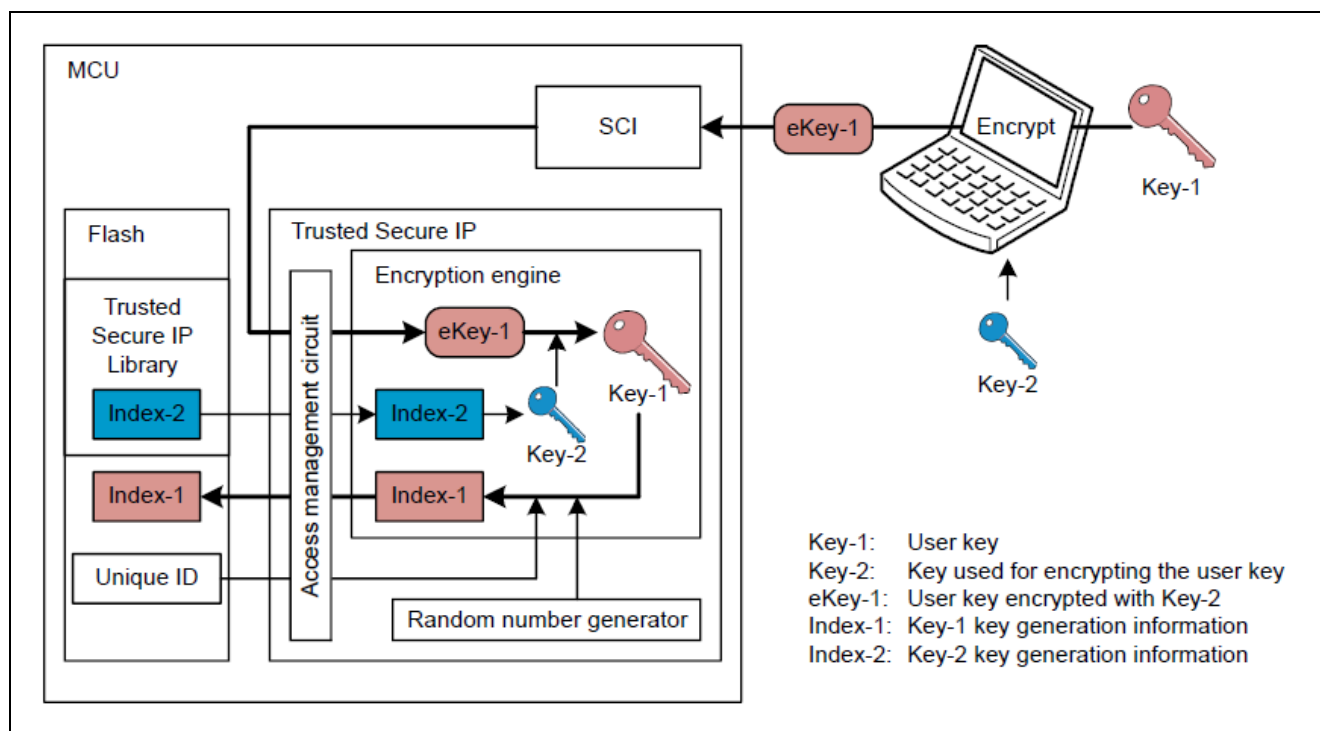

Figure 1.1 Diagram of Key Installation Process (Reproduced from Figure 52.4 in section 52, Trusted Secure IP (TSIP), in RX65N Group, RX651 Group, User's Manual: Hardware)

1.2 TSIP Overview

The Trusted Secure IP (TSIP) block on RX Family MCUs creates a secure area inside the MCU by monitoring for unauthorized access attempts. This ensures that the TSIP can utilize the encryption engine and user key (encryption key) reliably and securely. The TSIP handles the encryption key in a format called a wrapped key that is secure and unreadable outside the TSIP block. This means that the encryption key, the most important element in reliable and secure encryption, can be stored in the flash memory.

The TSIP block has a safe area that contains the encryption engine and storage for the encryption key in plaintext format.

The TSIP restores from the wrapped key the encryption key used for cryptographic operations. This operation is performed internally by the TSIP. The wrapped key is tied to an HUK derived from a unique ID, making it device-specific. This means that even if a wrapped key is copied from one device to a different device it cannot be used on the second device. To access the TSIP hardware an application must use the TSIP driver.

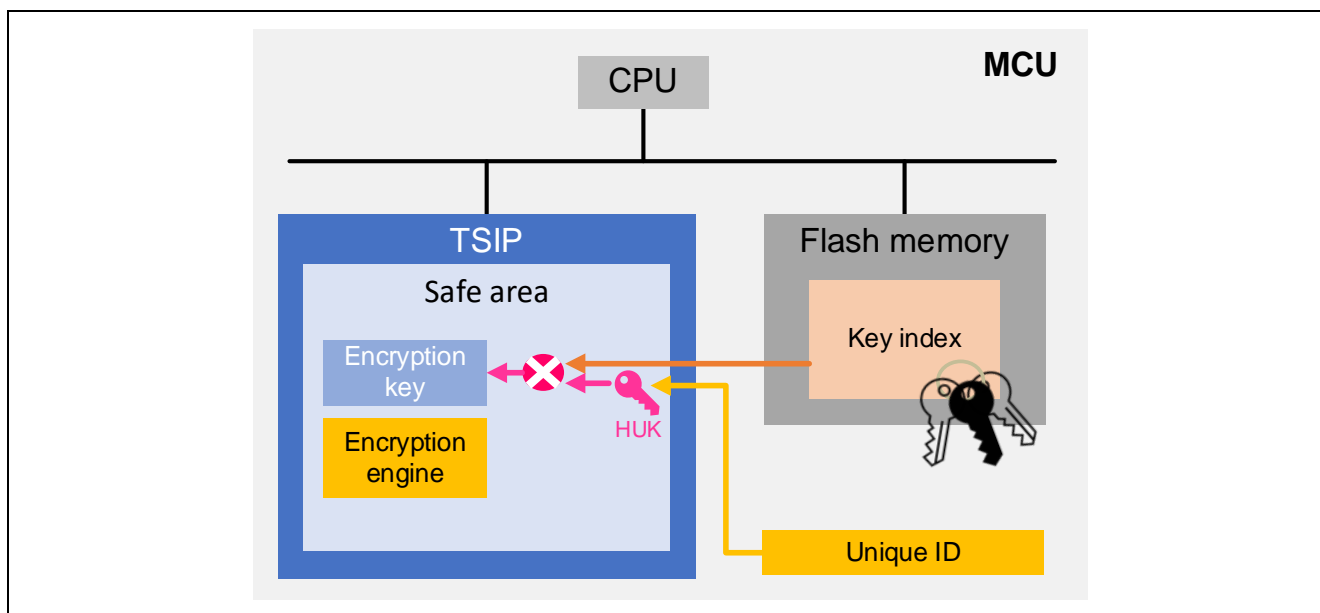

Figure 1.2 MCU Incorporating TSIP

1.3 Structure of Product Files

Table 1.2 below lists the files included in the product.

Table 1-2 Structure of Product Files

File/Directory (Bold) Name		Description

File/Directory (Bold) Name		Description
tool		Tool folder
	renesas_secure_flash_programmer	Tool for encrypting keys and user programs (includes source code)
	Renesas Secure Flash Programmer.exe	Tool for encrypting keys and user programs

Note: 1. "rxXXX" represents the RX group names.

2. "bbb" is the name of the supported board.

RSK : rsk

MCB : mcb

1.4 Development Environment

The TSIP driver was developed using the tools described below. When developing your own applications, use the versions of the software indicated below, or newer.

1. Integrated development environment

Refer to the "Integrated development environment" item under 7.1, Confirmed Operation Environment.

2. C compiler

Refer to the "C compiler" item under 7.1, Confirmed Operation Environment.

3. Emulator/debugger

E1, E20, or E2 Lite

4. Evaluation boards

Refer to the "Board used" item under 7.1, Confirmed Operation Environment. All of the boards listed are special product versions with cryptographic functionality. Make sure to confirm the product model name before ordering. e² studio and CC-RX were used in combination for evaluation and to create the demo project.

The project conversion function can be used to convert projects from e² studio to CS+. If you encounter errors such as compiler errors, please contact your Renesas representative.

1.5 Code Size

The table below lists the ROM and RAM sizes and the maximum stack usage associated with this module.

The values listed in the table below have been confirmed under the following conditions:

Module revision: r_tsip_rx rev1.20

Compiler version: Renesas Electronics C/C++ Compiler Package for RX Family V3.05.00
(integrated development environment default settings with “-lang = c99” option added)

GCC for Renesas RX 8.3.0.202311
(integrated development environment default settings with “-std = gnu99” option added)

IAR C/C++ Compiler for Renesas RX version 4.20.01
(integrated development environment default settings)

ROM, RAM, and Stack Sizes				
Device	Category	Memory Used		
		Renesas Compiler	GCC	IAR Compiler
TSIP-Lite	ROM	59,063 bytes	55,548 bytes	58,755 bytes
	RAM	804 bytes	804 bytes	804 bytes
	Stack	184 bytes	—	164 bytes
TSIP	ROM	436,167 bytes	403,972 bytes	416,782 bytes
	RAM	7,428 bytes	7,428 bytes	7,428 bytes
	Stack	1,684 bytes	—	1,376 bytes

1.6 Sections

The TSIP driver uses the default sections.

In sample programs, the sections C_FIRMWARE_UPDATE_CONTROL_BLOCK and C_FIRMWARE_UPDATE_CONTROL_BLOCK_MIRROR are used. Settings for these sections are configured automatically if CC-RX is set as the compiler and the TSIP driver is added to the project using Smart Configurator. Moreover, sample programs uses C_ENCRYPTED_KEY_BLOCK. If changes are required, edit the section setting.

When using the secure boot functionality, the sections BSECURE_BOOT*, PSECURE_BOOT, PSECURE_BOOT_ERASE, CSECURE_BOOT*, DSECURE_BOOT*, and RSECURE_BOOT* are used.

1.7 Performance

Performance information for TSIP-Lite drivers (RX231, RX23W, RX26T, RX66T, and RX72T) and TSIP drivers (RX65N, RX671, RX72M, and RX72N) for each device group is shown below.

Performance is measured in cycles of ICLK, the core clock. The operating clock (PCLKB) for TSIP-Lite and TSIP is set to ICLK : PCLKB = 2 : 1. The drivers are built using CC-RX with optimization level 2. Refer to 7.1, Confirmed Operation Environment, for version information.

1.7.1 RX231

Note: Key exchange performance (excluding KeyAgreement) was measured with parameters fixed as follows: key exchange format = ECDHE and derived key type = AES-128.

2. API Information

2.1 Hardware Requirements

TSIP drivers can only be used with devices provided with a TSIP. Check the product number of the device to ensure that it incorporates a TSIP.

2.2 Software Requirements

The TSIP drivers are dependent on the following module:

r_bsp Use rev. 7.30 or later. (BSP stands for “board support package.”)

[RX231 and RX23W (On the RX231, portions of the comment below following “= Chip” differ.)]

Change the value in the following macro in r_bsp_config.h in the r_config folder to 0xB or 0xD (RX23W only).

```
/* Chip version.
   Character(s) = Value for macro =
   A             = 0xA             = Chip version A
                                   = Security function not included.
   B             = 0xB             = Chip version B
                                   = Security function included.
   C             = 0xC             = Chip version C
                                   = Security function not included.
   D             = 0xD             = Chip version D
                                   = Security function included.
*/
#define BSP_CFG_MCU_PART_VERSION      (0xB)
```

[RX26T]

Change the value in the following macro in r_bsp_config.h in the r_config folder to 0xB, or 0xD.

```
/* Whether PGA differential input, Encryption and USB are included or not.
   Character(s) = Value for macro = Description
   A = 0xA     = Only CAN 2.0 protocol supported, without TSIP-Lite
   B = 0xB     = Only CAN 2.0 protocol supported, with TSIP-Lite
   C = 0xC     = CAN FD protocol supported, without TSIP-Lite
   D = 0xD     = CAN FD protocol supported, with TSIP-Lite
*/
#define BSP_CFG_MCU_PART_FUNCTION     (0xD)
```

[RX66T and RX72T (On the RX72T, portions of the comment below following “= PGA” differ.)]

Change the value in the following macro in `r_bsp_config.h` in the `r_config` folder to 0xE, 0xF, or 0x10.

```
/* Whether PGA differential input, Encryption and USB are included or not.
   Character(s) = Value for macro = Description
   A = 0xA = PGA differential input included, Encryption module not included,
           USB module not included
   B = 0xB = PGA differential input not included, Encryption module not
           included, USB module not included
   C = 0xC = PGA differential input included, Encryption module not included,
           USB module included
   E = 0xE = PGA differential input included, Encryption module included,
           USB module not included
   F = 0xF = PGA differential input not included, Encryption module included,
           USB module not included
   G = 0x10 = PGA differential input included, Encryption module included,
           USB module included
*/
#define BSP_CFG_MCU_PART_FUNCTION      (0xE)
```

[RX66N, RX671, RX72M, and RX72N]

Change the value in the following macro in `r_bsp_config.h` in the `r_config` folder to 0x11.

```
/* Whether Encryption is included or not.
   Character(s) = Value for macro = Description
   D             = 0xD             = Encryption module not included
   H             = 0x11            = Encryption module included
*/
#define BSP_CFG_MCU_PART_FUNCTION      (0x11)
```

[RX65N]

Change the value in the following macro in `r_bsp_config.h` in the `r_config` folder to true.

```
/* Whether Encryption and SDHI/SDSI are included or not.
   Character(s) = Value for macro = Description
   A            = false = Encryption module not included, SDHI/SDSI module not included
   B            = false = Encryption module not included, SDHI/SDSI module included
   D            = false = Encryption module not included, SDHI/SDSI module included
   E            = true  = Encryption module included, SDHI/SDSI module not included
   F            = true  = Encryption module included, SDHI/SDSI module included
   H            = true  = Encryption module included, SDHI/SDSI module included
*/
#define BSP_CFG_MCU_PART_ENCRYPTION_INCLUDED (true)
```

2.3 Supported Toolchain

The operation of the TSIP driver has been confirmed with the toolchain indicated in 7.1, Confirmed Operation Environment.

2.4 Header File

All API calls and their supported interface definitions are contained in `r_tsip_rx_if.h`.

2.5 Integer Types

The TSIP driver uses ANSI C99 integer types defined in `stdint.h`.

In the binary version of TSIP driver, double size is set to 64 bit.

2.6 Data Structures

The data structures used by the TSIP driver are defined in `r_tsip_rx_if.h`.

2.7 Return Values

The return values of the TSIP driver API functions are listed below. The enumerated types of return values are defined in `r_tsip_rx_if.h`.

```
typedef enum e_tsip_err
{
    TSIP_SUCCESS=0,
    TSIP_ERR_FAIL,                // Self-check failed to terminate normally,
                                // illegal MAC detected by R_TSIP_VerifyFirmwareMAC,
                                // or R_TSIP_API function internal error.
    TSIP_ERR_RESOURCE_CONFLICT,  // A resource conflict occurred because a resource required by
                                // the processing routine was in use by another processing routine.
    TSIP_ERR_RETRY,              // Self-check terminated with an error. Run the function again.
    TSIP_ERR_KEY_SET,            // An invalid wrapped key was input.
    TSIP_ERR_AUTHENTICATION,     // Authentication failed,
                                // or signature verification using RSASSA-PKCS1-V.1.5 failed.
    TSIP_ERR_CALLBACK_UNREGIST,  // Callback function not registered.
    TSIP_ERR_PARAMETER,          // Invalid input date.
    TSIP_ERR_PROHIBIT_FUNCTION,  // An invalid function call occurred.
    TSIP_RESUME_FIRMWARE_GENERATE_MAC, // There is additional processing. It is necessary to call
                                // the API again.
    TSIP_ERR_VERIFICATION_FAIL,  // Verification of TLS 1.3 handshaking failed.
}e_tsip_err_t
```

2.8 Adding the FIT Module to Your Project

This module must be added to each project in which it is used. Renesas recommends using Smart Configurator as described in (1) or (3) below. However, Smart Configurator does not support all RX devices. If your RX device is not supported, use the method described in (2) or (4).

- (1) Adding the FIT module to your project using Smart Configurator in e² studio
Using Smart Configurator in e² studio allows you to add the FIT module to your project automatically. Refer to the application note “Renesas e² studio Smart Configurator User Guide” (R20AN0451) for details.
- (2) Adding the FIT module to your project using FIT Configurator in e² studio
Using FIT Configurator in e² studio allows you to add the FIT module to your project automatically. Refer to the application note “Adding Firmware Integration Technology Modules to Projects (R01AN1723)” for details.
- (3) Adding the FIT module to your project using Smart Configurator in CS+
Using Smart Configurator Standalone Version in CS+ allows you to add the FIT module to your project automatically. Refer to the application note “Renesas e² studio Smart Configurator User Guide (R20AN0451)” for details.
- (4) Adding the FIT module to your project in CS+
Manually add the FIT module to your project in CS+. Refer to the application note “Adding Firmware Integration Technology Modules to CS+ Projects (R01AN1826)” for details.

3. TSIP Driver Usage

The TSIP driver for the RX Family provides the following functions:

- Random number generation
- Secure key management
- Unauthorized access monitoring
- Acceleration of cryptographic operations
- Acceleration of TLS processing

The keys handled by the TSIP driver (input and output keys) are opaque keys wrapped using a device-specific key called a hardware unique key (HUK), which is accessible only by the TSIP. In the case of the RX TSIP driver, this type of opaque key is called a wrapped key. The TSIP driver implements secure key management by wrapping keys using the hardware unique key. This provides key confidentiality and detection of tampering outside of the TSIP.

The unauthorized access monitoring by the TSIP covers all cryptographic processing performed by the driver and is always enabled during cryptographic operations. If tampering with cryptographic operations is detected while the driver is in use, the driver stops operation.

There are two types of APIs provided by the TSIP driver for accelerating cryptographic operations: those that provide cryptographic operations with a single API and those that provide them with multiple APIs. In this document, the former are referred to as single-part operations and the latter as multi-part operations.

APIs for multi-part operations are provided for symmetric key cryptography and hashes split on the Init-Update-Final model, and APIs for single-part operations are provided for other ciphers.

3.1 Recovering after Unauthorized Access Detection

Unauthorized access monitoring by the TSIP is always enabled during execution of all cryptographic APIs. If tampering with cryptographic operations is detected while the driver is in use, the driver enters an infinite loop to stop operation.

Whether or not the operation of the TSIP driver is stopped in an infinite loop due to unauthorized access must be detected by the user application using a watchdog timer or other means.

If unauthorized access is detected by the user application, appropriate measures should be taken to satisfy the system security policy, such as log recording or restarting the system.

To recover from unauthorized access detection, close the TSIP driver once with `R_TSIP_Close()` and restart the TSIP with `R_TSIP_Open()`, or reset the device.

3.2 Avoiding TSIP Access Conflicts

All RX Family products provided with a TSIP allow use of only one channel of the TSIP. The TSIP driver, like many peripheral IP drivers, takes over the hardware resources of the TSIP while driver APIs are running.

Among the APIs that provide multi-part operations, the symmetric key cryptography and HMAC functions continue to occupy the TSIP hardware resources until the series of multi-part operations is complete.

Therefore, keep in mind the following two points to avoid TSIP access conflicts when using the TSIP driver in a user application program:

1. While a TSIP driver API is being executed, other TSIP driver APIs must not be executed.
2. In the case of symmetric key cryptography and HMAC functions, other TSIP driver APIs cannot execute until the series of operations (Init/Update/Final) currently being processed is complete.

Note that the message digest generation function can execute other TSIP driver APIs while a series of multi-part operations is in progress.

If a TSIP driver API causes a TSIP hardware resource access conflict, the API returns TSIP_ERR_RESOURCE_CONFLICT or TSIP_ERR_PROHIBIT_FUNCTION.

Use the following method to avoid TSIP access conflicts when using the TSIP driver:

- Use the APIs in an order that does not cause TSIP access conflicts.

3.3 BSP FIT Module Integration

The TSIP driver uses the BSP FIT module internally as described in section 2.2. When using the TSIP driver, link to the following APIs. For details, refer to the application note “Board Support Package Module Using Firmware Integration Technology” (R01AN1685xJxxxxxx).

- R_BSP_RegisterProtectEnable()
- R_BSP_RegisterProtectDisable()
- R_BSP_InterruptsEnable()
- R_BSP_InterruptsDisable()

It is assumed that BSP startup has completed before these APIs are called. If BSP startup is not used, call R_BSP_StartupOpen() beforehand. Also initialize internal variables used within the above APIs.

3.4 Single-Part and Multi-Part Operations

There are two types of APIs provided by the TSIP driver for accelerating cryptographic operations: those that provide cryptographic operations with a single API and those that provide them with multiple APIs. In this document, the former are referred to as single-part operations and the latter as multi-part operations.

APIs for multi-part operations are provided for symmetric key cryptography and hashes (message digest generation and HMAC functions), and APIs for single-part operations are provided for other ciphers.

Multi-part operations are APIs which split a single cryptographic operation into a sequence of separate steps (Init-Update-Final). This enables fine control over the configuration of the cryptographic operation and allows message data to be processed intermittently instead of all at once.

All multi-part operations conform to the following pattern:

Init: Initialize and start the operation.

If initialization is successful, the operation is active. If initialization fails, the operation enters an error state.

Update: Update the operation.

The update function can provide additional parameters, supply data for processing, or generate output.

If updating is successful, the operation remains active. If updating fails, the operation enters an error state.

Final: Call the applicable finalizing function to end the operation.

This function accepts any final input, generates any final output, and then releases any resources associated with the operation.

If finalizing is successful, the operation returns to the inactive state. If updating fails, the operation enters an error state.

3.5 Initializing and Terminating the Driver

The driver provides APIs for the following driver management operations:

No.	API	Description
1	R_TSIP_Open	Opens the TSIP driver. Initializes the TSIP and performs a self-test of the TSIP's fault detection and random number generator circuits.
2	R_TSIP_Close	Closes the TSIP driver.
3	R_TSIP_SoftwareReset	Resets the TSIP driver.
4	R_TSIP_GetVersion	Gets the version number of the TSIP driver.

Applications using the driver must call R_TSIP_Open() to initialize the driver before using other functions. Also, when terminating use of the driver, R_TSIP_Close() must be called.

If problems occur while using the driver and there is a need to reset the driver and its control target, the TSIP, it is necessary to call R_TSIP_SoftwareReset() or R_TSIP_Open() after calling R_TSIP_Close(). Call R_TSIP_SoftwareReset() to apply a reset without resuming TSIP driver processing, or call R_TSIP_Open() to resume TSIP driver processing.

R_TSIP_Open() performs a self-test to detect hardware failure of the TSIP and to check for abnormalities in the random number generation circuit. The self-test of the random number generator circuit implements the health test described in NIST SP800-90B on the data generated by the physical random number generator, evaluates the entropy, and generates a random number seed.

3.6 Random Number Generation

The driver provides an API for generating random numbers.

No.	API	Description
1	R_TSIP_GenerateRandomNumber	Generates random numbers using the CTR-DRBG method described in NIST SP800-90A.

3.7 Key Management

The driver provides APIs for the following key management operations:

No.	API	Description
1	R_TSIP_GenerateUpdateKeyRingKeyIndex R_TSIP_GenerateAesXXXKeyIndex R_TSIP_GenerateTdesKeyIndex R_TSIP_GenerateArc4KeyIndex R_TSIP_GenerateShaXXXHmacKeyIndex R_TSIP_GenerateRsaXXXPublicKeyIndex R_TSIP_GenerateRsaXXXPrivateKeyIndex R_TSIP_GenerateEccPXXXPublicKeyIndex R_TSIP_GenerateEccPXXXPrivateKeyIndex R_TSIP_GenerateTlsRsaPublicKeyIndex	These key injection APIs use the Renesas Key Wrap service to convert a user key into a wrapped key wrapped using an HUK. They can be used for key injection at the factory. [Aes] XXX = 128, 256 [Hmac] XXX = 1, 256 [Rsa] XXX = 1024, 2048, 3072* ¹ , 4096* ¹ [Ecc] XXX = 192, 224, 256, 384
2	R_TSIP_UpdateAesXXXKeyIndex R_TSIP_UpdateTdesKeyIndex R_TSIP_UpdateArc4KeyIndex R_TSIP_UpdateRsaXXXPublicKeyIndex R_TSIP_UpdateRsaXXXPrivateKeyIndex R_TSIP_UpdateEccPXXXPublicKeyIndex R_TSIP_UpdateEccPXXXPrivateKeyIndex	These key update APIs use an update keyring to convert a user key into a wrapped key wrapped using an HUK. They can be used to update keys in the field. [Aes] XXX = 128, 256 [Hmac] XXX = 1, 256 [Rsa] XXX = 1024, 2048, 3072* ¹ , 4096* ¹ [Ecc] XXX = 192, 224, 256, 384
3	R_TSIP_GenerateAesXXXRandomKeyIndex R_TSIP_GenerateTdesRandomKeyIndex R_TSIP_GenerateArc4RandomKeyIndex R_TSIP_GenerateRsaXXXRandomKeyIndex R_TSIP_GenerateEccPXXXRandomKeyIndex	These APIs generate a random key and convert it to a wrapped key. [Aes] XXX = 128, 256 [Rsa] XXX = 1024, 2048 [Ecc] XXX = 192, 224, 256, 384

Note: 1. Only public keys are provided in these key lengths.

3.7.1 Key Injection and Updating

Key injection and key updating provide a mechanism enabling secure delivery of user keys by converting them into wrapped keys wrapped using an HUK.

Wrapping a secret key using an HUK involves encryption and adding a MAC, while wrapping a public key only involves adding a MAC. The public wrapped key is not encrypted, so the plaintext public key can be extracted from it.

The first 128 bits of the UFPK or KUK for wrapping is used as the key, and the user key is encrypted in AES-128 CBC mode. Then the trailing 128 bits of the provisioning key or update keyring for wrapping is used to calculate the MAC of the user key using AES-128 CBC-MAC. The MAC of the user key is concatenated to the user key and both are encrypted to generate an encrypted user key.

This application note explains the provisioning key and encrypted provisioning key using the key attached to the sample program. These key for mass production needs to be newly generated. An application note with these key details is available.

We will provide the product to customers who will be adopting or plan to adopt a Renesas microcontroller. Please contact your local Renesas Electronics sales office or distributor.

<https://www.renesas.com/contact/>

3.8 Symmetric Key Cryptography

The driver provides APIs for the following types of symmetric cryptographic operations:

No.	API	Description
1	R_TSIP_AesXXX[Mode]Encrypt* R_TSIP_AesXXX[Mode]Decrypt* R_TSIP_AesXXXCtr* R_TSIP_Tdes[Mode]Encrypt* R_TSIP_Tdes[Mode]Decrypt* R_TSIP_Arc4Encrypt* R_TSIP_Arc4Decrypt*	Symmetric key cryptography AES 128-/256-bit: ECB, CBC, CTR encryption and decryption TDES: ECB, CBC encryption and decryption ARC4 XXX = 128, 256 Mode = Ecb, Cbc
2	R_TSIP_AesXXXGcmEncrypt* R_TSIP_AesXXXGcmDecrypt* R_TSIP_AesXXXCcmEncrypt* R_TSIP_AesXXXCcmDecrypt*	Authenticated encryption with associated data (AEAD) AES-GCM, AES-CCM 128-/256-bit encryption and decryption XXX = 128, 256
3	R_TSIP_AesXXXCmacGenerate* R_TSIP_AesXXXCmacVerify*	Message authentication codes (MAC) AES-CMAC 128-/256-bit MAC operation XXX = 128, 256
4	R_TSIP_AESXXXKeyWrap R_TSIP_AESXXXKeyUnwrap	AES key wrap/ unwrap XXX = 128, 256

* = Init, Update, Final

A set of API functions that enable multi-part operations is provided for each type of symmetric cryptographic operation. For details on multi-part operations, refer to 3.4, Single-Part and Multi-Part Operations.

3.8.1 Symmetric Key Cryptography

The encryption operations for each AES mode operate as follows:

Call R_TSIP_AesXXX[Mode]EncryptInit() to specify the required key and initial vector. Call the R_TSIP_AesXXX[Mode]EncryptUpdate() function for the chunks of data comprising the plaintext message in consecutive block units. To complete the encryption operation, call R_TSIP_AesXXX[Mode]EncryptFinal().

The decryption operations for each AES mode operate as follows:

Call R_TSIP_AesXXX[Mode]DecryptInit() to specify the required key and initial vector. Call the R_TSIP_AesXXX[Mode]DecryptUpdate() function for the chunks of data comprising the ciphertext message in consecutive block units. To complete the decryption operation, call R_TSIP_AesXXX[Mode]DecryptFinal().

The TDES and ARC4 cryptographic APIs operate in the same way as those for AES.

3.8.2 Authenticated Encryption with Associated Data (AEAD)

The AES-GCM encryption operations operate as follows:

Call R_TSIP_AesXXXGcmEncryptInit() to specify the required key and initial vector.

Call the R_TSIP_AesXXXGcmEncryptUpdate() function for the chunks of data comprising the plaintext message in consecutive block units. To complete the encryption operation, call R_TSIP_AesXXXGcmEncryptFinal().

The AES-GCM decryption operations operate as follows:

Call R_TSIP_AesXXXGCMDecryptInit() to specify the required key and initial vector. Call the R_TSIP_AesXXXGCMDecryptUpdate() function for the chunks of data comprising the ciphertext message in consecutive block units. To complete the decryption operation, compute the authentication tag, and verify it against a reference value, call R_TSIP_AesXXXGcmDecryptFinal().

The AES-CCM cryptographic APIs operate in the same way as those for AES-GCM.

3.8.3 Message Authentication Code (MAC)

The MAC generation operations using AES-CMAC operate as follows:

Call `R_TSIP_AesXXXCmacGenerateInit()` to specify the required key. Call the `R_TSIP_AesXXXCmacGenerateUpdate()` function for the consecutive chunks of data comprising the message. To complete generating the MAC for the message, call `R_TSIP_AesXXXCmacGenerateFinal()`.

AES-CMAC verification operates as follows:

Call `R_TSIP_AesXXXCmacVerifyInit()` to specify the required key.

Call the `R_TSIP_AesXXXCmacVerifyUpdate()` function for the chunk of data comprising the message. To verify the MAC of the message, call `R_TSIP_AesXXXCmacVerifyFinal()` and specify the MAC required for verification.

3.9 Asymmetric Cryptography

The driver provides APIs for the following asymmetric cryptographic operations:

No.	API	Description
1	R_TSIP_RsaesPkcsXXXEncrypt R_TSIP_RsaesPkcsXXXDecrypt	[RSAES-PKCS1-V1_5 encrypt] XXX = 1024, 2048, 3072, 4096 [RSAES-PKCS1-V1_5 decrypt] XXX = 1024, 2048
2	R_TSIP_RsassaPkcsXXXSignatureGenerate R_TSIP_RsassaPkcsXXXSignatureVerification R_TSIP_RsassaPssXXXSignatureGenerate R_TSIP_RsassaPssXXXSignatureVerification R_TSIP_EcdsaPXXXSignatureGenerate R_TSIP_EcdsaPXXXSignatureVerification	[RSASSA-PKCS1-V1_5 Sign] XXX = 1024, 2048 [RSASSA-PKCS1-V1_5 verify] XXX = 1024, 2048, 3072, 4096 [RSASSA-PSS sign/verify] XXX = 1024, 2048 [ECDSA sign/verify] XXX = 192, 224, 256, 384

Only APIs that implement encryption, decryption, signature generation, and verification as single-part operations are provided for asymmetric cryptographic operations.

3.10 Hash Functions

The driver provides APIs for the following hash operations:

No.	API	Description
1	R_TSIP_ShaXXX* R_TSIP_Md5* R_TSIP_GetCurrentHashDigestValue	Message digests (hash functions) SHA-1, SHA-256 XXX = 1, 256
2	R_TSIP_ShaXXXHmacGenerate* R_TSIP_ShaXXXHmacVerify*	Message authentication codes (MAC) HMAC: HMAC-SHA1, HMAC-SHA256 XXX = 1, 256

* = Init, Update, Final

A set of API functions that enable multi-part operations is provided for each type of hash operation. For details on multi-part operations, refer to 3.4, Single-Part and Multi-Part Operations.

3.10.1 Message Digest (Hash Function)

The hash operation APIs are used as follows:

Call R_TSIP_ShaXXXInit() to specify the newly allocated work area for the operation. Call R_TSIP_ShaXXXUpdate() for the consecutive chunks of data comprising the message. Call R_TSIP_ShaXXXFinal() to calculate the digest of the message. R_TSIP_GetCurrentHashDigestValue() can be called after R_TSIP_ShaXXXUpdate() to retrieve data while the hash operation is in progress.

The MD5 APIs are used in the same way as those for SHA.

3.10.2 Message Authentication Code (HMAC)

The HMAC generation APIs are used as follows:

Call `R_TSIP_ShaXXXHmacGenerateInit()` to specify the required key and newly allocated work area for the operation. Call `R_TSIP_ShaXXXHmacGenerateUpdate()` for the consecutive chunks of data comprising the message. To complete MAC generation for the message, call `R_TSIP_ShaXXXHmacGenerateFinal()`.

The HMAC verification APIs are used as follows:

Call `R_TSIP_ShaXXXHmacVerifyInit()` to specify the required key and newly allocated work area for the operation. Call `R_TSIP_ShaXXXHmacVerifyUpdate()` for the consecutive chunks of data comprising the message. To verify the MAC of a message, call `R_TSIP_ShaXXXHmacVerifyFinal()` and specify the required MAC for verification.

3.11 Firmware Update

The TSIP driver supports firmware update functionality to decrypt encrypted programs and perform MAC verification.

The driver provides APIs for the following firmware update operations:

No.	API	Description
1	R_TSIP_StartUpdateFirmware	Transitions the TSIP to a state in which the firmware update functionality can be used.
2	R_TSIP_GenerateFirmwareMAC	Decrypts an encrypted program, performs MAC verification, and generates a MAC.
3	R_TSIP_VerifyFirmwareMAC	Performs verification of a specified area using the MAC generated by R_TSIP_GenerateFirmwareMAC.

The sample program to execute firmware update and an application note with details of this function is available.

We will provide the product to customers who will be adopting or plan to adopt a Renesas microcontroller. Please contact your local Renesas Electronics sales office or distributor.

<https://www.renesas.com/contact/>

4. API Functions

4.1 List of APIs

The TSIP driver implements the following APIs:

1. Common function APIs
2. Random number generation API
3. AES encryption/decryption APIs
4. DES encryption/decryption APIs
5. ARC4 encryption/decryption APIs
6. RSA operation APIs
7. ECC signature generation/verification APIs
8. HASH calculation APIs
9. HMAC generation/verification APIs
10. DH calculation API
11. ECDH key exchange APIs
12. Key wrap APIs
13. TLS function APIs
14. Firmware update/secure boot APIs

The APIs implemented in the TSIP driver are summarized in the tables below. "XXX" in the name of an API represents either the bit length or the SHA mode.

Table 4-1 Common Function APIs

API	Description	TSIP-Lite	TSIP
R_TSIP_Open	Enables TSIP functionality.	✓	✓
R_TSIP_Close	Disables TSIP functionality.	✓	✓
R_TSIP_SoftwareReset	Resets the TSIP module.	✓	✓
R_TSIP_GetVersion	Outputs the TSIP driver version.	✓	✓
R_TSIP_GenerateUpdateKeyRingKeyIndex	Generates a wrapped key for key updating.	✓	✓

Table 4-2 Random Number Generation API

API	Description	TSIP-Lite	TSIP
R_TSIP_GenerateRandomNumber	Generates random number.	✓	✓

Table 4-3 AES Encryption/Decryption APIs

API	Description	TSIP-Lite	TSIP
R_TSIP_GenerateAesXXXKeyIndex	Generates an AES wrapped key.	✓	✓
R_TSIP_UpdateAesXXXKeyIndex	Updates an AES wrapped key.	✓	✓
R_TSIP_GenerateAesXXXRandomKeyIndex	Generates an AES key from a random number and outputs the wrapped key.	✓	✓
R_TSIP_AesXXXEcbEncryptInit R_TSIP_AesXXXEcbEncryptUpdate R_TSIP_AesXXXEcbEncryptFinal	Performs AES-ECB mode encryption.	✓	✓
R_TSIP_AesXXXEcbDecryptInit R_TSIP_AesXXXEcbDecryptUpdate R_TSIP_AesXXXEcbDecryptFinal	Performs AES-ECB mode decryption.	✓	✓
R_TSIP_AesXXXCbcEncryptInit R_TSIP_AesXXXCbcEncryptUpdate R_TSIP_AesXXXCbcEncryptFinal	Performs AES-CBC mode encryption.	✓	✓
R_TSIP_AesXXXCbcDecryptInit R_TSIP_AesXXXCbcDecryptUpdate R_TSIP_AesXXXCbcDecryptFinal	Performs AES128-CBC mode decryption.	✓	✓
R_TSIP_AesXXXCtrInit R_TSIP_AesXXXCtrUpdate R_TSIP_AesXXXCtrFinal	Performs AES-CTR mode encryption or decryption.	✓	✓
R_TSIP_AesXXXGcmEncryptInit R_TSIP_AesXXXGcmEncryptUpdate R_TSIP_AesXXXGcmEncryptFinal	Performs AES-GCM encryption.	✓	✓
R_TSIP_AesXXXGcmDecryptInit R_TSIP_AesXXXGcmDecryptUpdate R_TSIP_AesXXXGcmDecryptFinal	Performs AES-GCM decryption.	✓	✓
R_TSIP_AesXXXCcmEncryptInit R_TSIP_AesXXXCcmEncryptUpdate R_TSIP_AesXXXCcmEncryptFinal	Performs AES-CCM encryption.	✓	✓
R_TSIP_AesXXXCcmDecryptInit R_TSIP_AesXXXCcmDecryptUpdate R_TSIP_AesXXXCcmDecryptFinal	Performs AES-CCM decryption.	✓	✓
R_TSIP_AesXXXCmacGenerateInit R_TSIP_AesXXXCmacGenerateUpdate R_TSIP_AesXXXCmacGenerateFinal	Performs AES-CMAC mode MAC generation.	✓	✓
R_TSIP_AesXXXCmacVerifyInit R_TSIP_AesXXXCmacVerifyUpdate R_TSIP_AesXXXCmacVerifyFinal	Verifies a MAC generated in AES-CMAC mode.	✓	✓

Table 4-4 DES Encryption/Decryption APIs

API	Description	TSIP-Lite	TSIP
R_TSIP_GenerateTdesKeyIndex	Generates a TDES wrapped key.	—	✓
R_TSIP_UpdateTdesKeyIndex	Updates a TDES wrapped key.	—	✓
R_TSIP_GenerateTdesRandomKeyIndex	Generates a TDES key from a random number and outputs the wrapped key.	—	✓
R_TSIP_TdesEcbEncryptInit R_TSIP_TdesEcbEncryptUpdate R_TSIP_TdesEcbEncryptFinal	Performs TDES-ECB mode encryption.	—	✓
R_TSIP_TdesEcbDecryptInit R_TSIP_TdesEcbDecryptUpdate R_TSIP_TdesEcbDecryptFinal	Performs TDES-ECB mode decryption.	—	✓
R_TSIP_TdesCbcEncryptInit R_TSIP_TdesCbcEncryptUpdate R_TSIP_TdesCbcEncryptFinal	Performs TDES-CBC mode encryption.	—	✓
R_TSIP_TdesCbcDecryptInit R_TSIP_TdesCbcDecryptUpdate R_TSIP_TdesCbcDecryptFinal	Performs TDES-CBC mode decryption.	—	✓

Table 4-5 ARC4 Encryption/Decryption APIs

API	Description	TSIP-Lite	TSIP
R_TSIP_GenerateArc4KeyIndex	Generates an ARC4 wrapped key.	—	✓
R_TSIP_UpdateArc4KeyIndex	Updates an ARC4 wrapped key.	—	✓
R_TSIP_GenerateArc4RandomKeyIndex	Generates an ARC4 key from a random number and outputs the wrapped key.	—	✓
R_TSIP_Arc4EncryptInit R_TSIP_Arc4EncryptUpdate R_TSIP_Arc4EncryptFinal	Performs ARC4 encryption.	—	✓
R_TSIP_Arc4DecryptInit R_TSIP_Arc4DecryptUpdate R_TSIP_Arc4DecryptFinal	Performs ARC4 decryption.	—	✓

Table 4-6 RSA Operation APIs

API	Description	TSIP-Lite	TSIP
R_TSIP_GenerateRsaXXXPrivateKeyIndex	Generates an RSA secret wrapped key.	—	✓
R_TSIP_GenerateRsaXXXPublicKeyIndex	Generates an RSA public wrapped key.	—	✓
R_TSIP_UpdateRsaXXXPrivateKeyIndex	Updates an RSA secret wrapped key.	—	✓
R_TSIP_UpdateRsaXXXPublicKeyIndex	Updates an RSA public wrapped key.	—	✓
R_TSIP_GenerateRsaXXXRandomKeyIndex	Generates a pair of RSA wrapped keys from a random number. Exponent is fixed at 0x10001.	—	✓
R_TSIP_RsaesPkcsXXXEncrypt	Performs RSA encryption using RSAES-PKCS1-V1_5.	—	✓
R_TSIP_RsaesPkcsXXXDecrypt	Performs RSA decryption using RSAES-PKCS1-V1_5.	—	✓
R_TSIP_RsassaPkcsXXXSignatureGenerate	Generates a digital signature using RSASSA-PKCS1-V1_5.	—	✓
R_TSIP_RsassaPkcsXXXSignatureVerification	Verifies a digital signature using RSASSA-PKCS1-V1_5.	—	✓
R_TSIP_RsassaPssXXXSignatureGenerate	Generates a digital signature using RSASSA-PSS.	—	✓
R_TSIP_RsassaPssXXXSignatureVerification	Verifies a digital signature using RSASSA-PSS.	—	✓

Table 4-7 ECC Signature Generation/Verification APIs

API	Description	TSIP-Lite	TSIP
R_TSIP_GenerateEccPXXXPublicKeyIndex	Generates an ECC public wrapped key.	—	✓
R_TSIP_GenerateEccPXXXPrivateKeyIndex	Generates an ECC secret wrapped key.	—	✓
R_TSIP_UpdateEccPXXXPublicKeyIndex	Updates an ECC public wrapped key.	—	✓
R_TSIP_UpdateEccPXXXPrivateKeyIndex	Updates an ECC secret wrapped key.	—	✓
R_TSIP_GenerateEccPXXXRandomKeyIndex	Generates a pair of ECC wrapped keys from a random number.	—	✓
R_TSIP_EcdsaPXXXSignatureGenerate	Generates a digital signature using ECDSA.	—	✓
R_TSIP_EcdsaPXXXSignatureVerification	Verifies a digital signature using ECDSA.	—	✓

Table 4-8 HASH Calculation APIs

API	Description	TSIP-Lite	TSIP
R_TSIP_ShaXXXInit R_TSIP_ShaXXXUpdate R_TSIP_ShaXXXFinal	Performs hash value operations using SHA.	—	✓
R_TSIP_Md5Init R_TSIP_Md5Update R_TSIP_Md5Final	Performs hash value operations using MD5.	—	✓
R_TSIP_GetCurrentHashDigestValue	Gets hash value for current input.	—	✓

Table 4-9 HMAC Generation/Verification APIs

API	Description	TSIP-Lite	TSIP
R_TSIP_GenerateShaXXXHmacKeyIndex	Generates an SHA-HMAC wrapped key.	—	✓
R_TSIP_UpdateShaXXXHmacKeyIndex	Updates an SHA-HMAC wrapped key.	—	✓
R_TSIP_ShaXXXHmacGenerateInit R_TSIP_ShaXXXHmacGenerateUpdate R_TSIP_ShaXXXHmacGenerateFinal	Performs SHA-HMAC generation.	—	✓
R_TSIP_ShaXXXHmacVerifyInit R_TSIP_ShaXXXHmacVerifyUpdate R_TSIP_ShaXXXHmacVerifyFinal	Performs SHA-HMAC verification.	—	✓

Table 4-10 DH Calculation API

API	Description	TSIP-Lite	TSIP
R_TSIP_Rsa2048DhKeyAgreement	Performs DH operations using RSA-2048.	—	✓

Table 4-11 ECDH Key Exchange APIs

API	Description	TSIP-Lite	TSIP
R_TSIP_EcdhP256Init	Prepares for performance of ECDH P-256 key exchange operations.	—	✓
R_TSIP_EcdhP256ReadPublicKey	Verifies the ECC P-256 public key signature of the other key exchange party.	—	✓
R_TSIP_EcdhP256MakePublicKey	Signs an ECC P-256 secret key.	—	✓
R_TSIP_EcdhP256CalculateSharedSecretIndex	Calculates the shared secret Z from the public key of the other key exchange party and your own secret key.	—	✓
R_TSIP_EcdhP256KeyDerivation	Derives Z from a shared key.	—	✓
R_TSIP_EcdheP512KeyAgreement	Performs ECDHE operations using Brainpool P512r1.	—	✓

Table 4-12 Key Exchange APIs

API	Description	TSIP-Lite	TSIP
R_TSIP_AesXXXKeyWrap	Wraps a key using an AES key.	✓	✓
R_TSIP_AesXXXKeyUnwrap	Unwraps a key wrapped with an AES key.	✓	✓

Table 4-13 TLS Function APIs

API	Description	TSIP -Lite	TSIP
R_TSIP_GenerateTlsRsaPublicKeyIndex	Generates an RSA public wrapped key used in TLS cooperation.	—	✓
R_TSIP_UpdateTlsRsaPublicKeyIndex	Updates an RSA public wrapped key used in TLS cooperation.	—	✓
R_TSIP_TlsRootCertificateVerification	Verifies a root CA certificate bundle.	—	✓
R_TSIP_TlsCertificateVerification	Verifies the signature of a server certificate or intermediate certificate.	—	✓
R_TSIP_TlsCertificateVerificationExtension	Verifies the signature of a server certificate or intermediate certificate.	—	✓
R_TSIP_TlsGeneratePreMasterSecret	Generates an encrypted pre-master secret.	—	✓
R_TSIP_TlsEncryptPreMasterSecretWithRsa2048PublicKey	Encrypts a pre-master secret using RSA-2048.	—	✓
R_TSIP_TlsGenerateMasterSecret	Generates an encrypted master secret.	—	✓
R_TSIP_TlsGenerateSessionKey	Outputs TLS communication keys.	—	✓
R_TSIP_TlsGenerateVerifyData	Generates a VerifyData message.	—	✓
R_TSIP_TlsServersEphemeralEcdhPublicKeyRetrieves	Verifies a server key exchange signature.	—	✓
R_TSIP_GenerateTlsP256EccKeyIndex	Generates a key pair from a random number used by the TLS cooperation function for elliptic curve cryptography over a 256-bit prime field.	—	✓
R_TSIP_TlsGeneratePreMasterSecretWithEccP256Key	Generates an ECC encrypted pre-master secret.	—	✓
R_TSIP_TlsGenerateExtendedMasterSecret	Generates an encrypted extended master secret.	—	✓
R_TSIP_GenerateTls13P256EccKeyIndex	Generates a key pair from a random number used by the TLS 1.3 cooperation function for elliptic curve cryptography over a 256-bit prime field.	—	✓
R_TSIP_Tls13GenerateEcdheSharedSecret	Generates a shared secret wrapped key.	—	✓
R_TSIP_Tls13GenerateHandshakeSecret	Generates a handshake secret wrapped key.	—	✓
R_TSIP_Tls13GenerateServerHandshakeTrafficKey	Generates a server write wrapped key and server finished wrapped key.	—	✓
R_TSIP_Tls13ServerHandshakeVerification	Verifies finished information provided by the server.	—	✓
R_TSIP_Tls13GenerateClientHandshakeTrafficKey	Generates a client write wrapped key and client finished wrapped key.	—	✓
R_TSIP_Tls13GenerateMasterSecret	Generates a master secret key index.	—	✓
R_TSIP_Tls13GenerateApplicationTrafficKey	Generates an application traffic secret wrapped key and an application traffic wrapped key.	—	✓
R_TSIP_Tls13UpdateApplicationTrafficKey	Updates an application traffic secret wrapped key and an application traffic wrapped key.	—	✓
R_TSIP_Tls13GenerateResumptionMasterSecret	Generates a resumption master secret wrapped key.	—	✓
R_TSIP_Tls13GeneratePreSharedKey	Generates a pre shared wrapped key.	—	✓
R_TSIP_Tls13GeneratePskBinderKey	Generates a binder wrapped key.	—	✓

API	Description	TSIP -Lite	TSIP
R_TSIP_Tls13GenerateResumptionHandshakeSecret	Generates a handshake secret wrapped key for resumption.	—	✓
R_TSIP_Tls13Generate0RttApplicationWriteKey	Generates a client write wrapped key for 0-RTT.	—	✓
R_TSIP_Tls13CertificateVerifyGenerate	Generates a CertificateVerify message to be sent to the server.	—	✓
R_TSIP_Tls13CertificateVerifyVerification	Verifies a CertificateVerify message received from the server.	—	✓
R_TSIP_GenerateTls13SVP256EccKeyIndex	Generates a key pair from a random number used by the TLS 1.3 cooperation function for elliptic curve cryptography over a 256-bit prime field.	—	✓
R_TSIP_Tls13SVGenerateEcdheSharedSecret	Generates a shared secret wrapped key.	—	✓
R_TSIP_Tls13SVGenerateHandshakeSecret	Generates a handshake secret wrapped key.	—	✓
R_TSIP_Tls13SVGenerateServerHandshakeTrafficKey	Generates a server write wrapped key and server finished wrapped key.	—	✓
R_TSIP_Tls13SVGenerateClientHandshakeTrafficKey	Generates a client write wrapped key and client finished wrapped key.	—	✓
R_TSIP_Tls13SVClientHandshakeVerification	Verifies finished information provided by the client.	—	✓
R_TSIP_Tls13SVGenerateMasterSecret	Generates a master secret wrapped key.	—	✓
R_TSIP_Tls13SVGenerateApplicationTrafficKey	Generates an application traffic secret wrapped key and application traffic wrapped key.	—	✓
R_TSIP_Tls13SVUpdateApplicationTrafficKey	Updates an application traffic secret wrapped key and application traffic wrapped key.	—	✓
R_TSIP_Tls13SVGenerateResumptionMasterSecret	Generates a resumption master secret wrapped key.	—	✓
R_TSIP_Tls13SVGeneratePreSharedKey	Generates a pre shared wrapped key.	—	✓
R_TSIP_Tls13SVGeneratePskBinderKey	Generates a binder wrapped key.	—	✓
R_TSIP_Tls13SVGenerateResumptionHandshakeSecret	Generates a handshake secret wrapped key for resumption.	—	✓
R_TSIP_Tls13SVGenerate0RttApplicationWriteKey	Generates a client write wrapped key for 0-RTT.	—	✓
R_TSIP_Tls13SVCertificateVerifyGenerate	Generates a CertificateVerify message to be sent to the client.	—	✓
R_TSIP_Tls13SVCertificateVerifyVerification	Verifies a CertificateVerify message received from the client.	—	✓
R_TSIP_Tls13EncryptInit R_TSIP_Tls13EncryptUpdate R_TSIP_Tls13EncryptFinal	Encrypts TLS 1.3 communication data.	—	✓
R_TSIP_Tls13DecryptInit R_TSIP_Tls13DecryptUpdate R_TSIP_Tls13DecryptFinal	Decrypts TLS 1.3 communication data.	—	✓

Table 4-14 Firmware Update APIs

API	Description	TSIP- Lite	TSIP
R_TSIP_StartUpdateFirmware	Transitions to firmware update mode.	✓	✓
R_TSIP_GenerateFirmwareMAC	Decrypts and generates the MAC for encrypted firmware.	✓	✓
R_TSIP_VerifyFirmwareMAC	Performs a MAC check on the firmware.	✓	✓

4.2 Detailed Descriptions of API Functions

4.2.1 Common Function APIs

4.2.1.1 R_TSIP_Open

Format

```
#include "r_tsip_rx_if.h"
e_tsip_err_t R_TSIP_Open (
    tsip_tls_ca_certification_public_key_index_t *key_index_1,
    tsip_update_key_ring_t *key_index_2
)
```

Parameters

key_index_1	Input	TLS cooperation RSA public wrapped key
key_index_2	Input	Wrapped KUK

Return Values

TSIP_SUCCESS	Normal termination
TSIP_ERR_FAIL	Abnormal termination of self-diagnostics
TSIP_ERR_RESOURCE_CONFLICT	Occurrence of resource conflict because a hardware resource needed by the processing routine was in use by another processing routine
TSIP_ERR_RETRY	Abnormal termination of self-diagnostics Run the function again.

Description

Enables use of TSIP functionality.

For key_index_1, input the "TLS cooperation RSA public wrapped key" generated by R_TSIP_GenerateTlsRsaPublicKeyIndex() or R_TSIP_UpdateTlsRsaPublicKeyIndex(). If the TLS cooperation function is not used, input a null pointer.

For key_index_2, input the "Wrapped KUK" generated by R_TSIP_GenerateUpdateKeyRingKeyIndex(). If the key update cooperation function is not used, input a null pointer.

Note: to prevent the RX MCU from transitioning to standby mode while R_TSIP_Open() is running, R_TSIP_Open() internally calls the R_BSP_InterruptsDisable() API to disable interrupts and then the R_BSP_InterruptsEnable() API to enable interrupts.

Reentrancy

Not supported.

4.2.1.2 R_TSIP_Close

Format

```
#include "r_tsip_rx_if.h"  
e_tsip_err_t R_TSIP_Close(void)
```

Parameters

None

Return Values

TSIP_SUCCESS

Normal termination

Description

Stops TSIP functionality.

Reentrancy

Not supported.

4.2.1.3 R_TSIP_SoftwareReset

Format

```
#include "r_tsip_rx_if.h"
void R_TSIP_SoftwareReset(void)
```

Parameters

None

Return Values

None

Description

Returns the TSIP to the initial state.

Reentrancy

Not supported.

4.2.1.4 R_TSIP_GetVersion

Format

```
#include "r_tsip_rx_if.h"
uint32_t R_TSIP_GetVersion(void)
```

Parameters

None

Return Values

Upper 2 bytes:	Major version (decimal notation)
Lower 2 bytes:	Minor version (decimal notation)

Description

This function can be used to obtain the TSIP driver version.

Reentrancy

Not supported.

4.2.1.5 R_TSIP_GenerateUpdateKeyRingKeyIndex

Format

```
#include "r_tsip_rx_if.h"
e_tsip_err_t R_TSIP_GenerateUpdateKeyRingKeyIndex(
    uint8_t *encrypted_provisioning_key,
    uint8_t *iv,
    uint8_t *encrypted_key,
    tsip_update_key_ring_t *key_index
)
```

Parameters

encrypted_provisioning_key	Input	W-UFPK
iv	Input	Initialization vector when generating encrypted_key
encrypted_key	Input	Encrypted KUK
key_index	Output	Wrapped KUK

Return Values

TSIP_SUCCESS:	Normal termination
TSIP_ERR_FAIL:	Occurrence of internal error
TSIP_ERR_RESOURCE_CONFLICT:	Occurrence of resource conflict because a hardware resource needed by the processing routine was in use by another processing routine

Description

This API outputs a wrapped key of KUK.

For encrypted_key, input the data indicated in 7.3.7, Update Keyring, encrypted using the UFPK.

Refer to 3.7.1, Key Injection and Updating, for an explanation of encrypted_provisioning_key, iv, and encrypted_key and how to use key_index.

Reentrancy

Not supported.

4.2.2 Random Number Generation

4.2.2.1 R_TSIP_GenerateRandomNumber

Format

```
#include "r_tsip_rx_if.h"
e_tsip_err_t R_TSIP_GenerateRandomNumber(
    uint32_t *random
)
```

Parameters

random	Output	4-word (16-byte) random number value
--------	--------	--------------------------------------

Return Values

TSIP_SUCCESS:	Normal termination
TSIP_ERR_RESOURCE_CONFLICT:	Occurrence of resource conflict because a hardware resource needed by the processing routine was in use by another processing routine

Description

This API can be used to generate an NIST SP800-90A-compliant 4-word random number value.

Reentrancy

Not supported.

4.2.3 AES

4.2.3.1 R_TSIP_GenerateAesXXXKeyIndex

Format

```
(1) #include "r_tsip_rx_if.h"
    e_tsip_err_t R_TSIP_GenerateAes128KeyIndex(
        uint8_t *encrypted_provisioning_key,
        uint8_t *iv,
        uint8_t *encrypted_key,
        tsip_aes_key_index_t *key_index
    )

(2) #include "r_tsip_rx_if.h"
    e_tsip_err_t R_TSIP_GenerateAes256KeyIndex(
        uint8_t *encrypted_provisioning_key,
        uint8_t *iv,
        uint8_t *encrypted_key,
        tsip_aes_key_index_t *key_index
    )
```

Parameters

encrypted_provisioning_key	Input	W-UFPK
iv	Input	Initialization vector when generating encrypted_key
encrypted_key	Input	Encrypted key encrypted using UFPK
key_index	Output	Wrapped key

Return Values

TSIP_SUCCESS:	Normal termination
TSIP_ERR_FAIL:	Occurrence of internal error
TSIP_ERR_RESOURCE_CONFLICT:	Occurrence of resource conflict because a hardware resource needed by the processing routine was in use by another processing routine

Description

R_TSIP_GenerateAes128KeyIndex is an API that outputs an AES 128-bit wrapped key.

R_TSIP_GenerateAes256KeyIndex is an API that outputs an AES 256-bit wrapped key.

For encrypted_key, input the data indicated in 7.3.1, AES, encrypted using the UFPK.

Refer to 3.7.1, Key Injection and Updating, for an explanation of encrypted_provisioning_key, iv, and encrypted_key and how to use key_index.

Reentrancy

Not supported.

4.2.3.2 R_TSIP_UpdateAesXXXKeyIndex

Format

```

(1) #include "r_tsip_rx_if.h"
    e_tsip_err_t R_TSIP_UpdateAes128KeyIndex(
        uint8_t *iv,
        uint8_t *encrypted_key,
        tsip_aes_key_index_t *key_index
    )
(2) #include "r_tsip_rx_if.h"
    e_tsip_err_t R_TSIP_UpdateAes256KeyIndex(
        uint8_t *iv,
        uint8_t *encrypted_key,
        tsip_aes_key_index_t *key_index
    )

```

Parameters

iv	Input	Initialization vector when generating encrypted_key
encrypted_key	Input	Encrypted key encrypted using KUK
key_index	Output	Wrapped key

Return Values

TSIP_SUCCESS:	Normal termination
TSIP_ERR_FAIL:	Occurrence of internal error
TSIP_ERR_RESOURCE_CONFLICT:	Occurrence of resource conflict because a hardware resource needed by the processing routine was in use by another processing routine

Description

R_TSIP_UpdateAes128KeyIndex is an API that updates the wrapped key of an AES 128 key.

R_TSIP_UpdateAes256KeyIndex is an API that updates the wrapped key of an AES 256 key.

For encrypted_key, input the data indicated in 7.3.1, AES, encrypted using the KUK.

Refer to 3.7.1, Key Injection and Updating, for an explanation of iv and encrypted_key and how to use key_index.

Reentrancy

Not supported.

4.2.3.3 R_TSIP_GenerateAesXXXRandomKeyIndex

Format

- ```
(1) #include "r_tsip_rx_if.h"
 e_tsip_err_t R_TSIP_GenerateAes128RandomKeyIndex(
 tsip_aes_key_index_t *key_index
)
(2) #include "r_tsip_rx_if.h"
 e_tsip_err_t R_TSIP_GenerateAes256RandomKeyIndex(
 tsip_aes_key_index_t *key_index
)
```

##### Parameters

|           |        |                                                            |
|-----------|--------|------------------------------------------------------------|
| key_index | Output | (1) 128-bit AES wrapped key<br>(2) 256-bit AES wrapped key |
|-----------|--------|------------------------------------------------------------|

##### Return Values

|                             |                                                                                                                                       |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| TSIP_SUCCESS:               | Normal termination                                                                                                                    |
| TSIP_ERR_RESOURCE_CONFLICT: | Occurrence of resource conflict because a hardware resource needed by the processing routine was in use by another processing routine |

##### Description

R\_TSIP\_GenerateAes128RandomKeyIndex is an API that outputs an AES 128-bit wrapped key.

R\_TSIP\_GenerateAes256RandomKeyIndex is an API that outputs an AES 256-bit wrapped key.

This API generates a user key from a random number within the TSIP. Therefore, no user key needs to be input. Encrypting data using the wrapped key output by this API makes it possible to prevent dead copying of data.

Refer to 3.7.1, Key Injection and Updating, for an explanation of how to use key\_index.

##### Reentrancy

Not supported.

---

**4.2.3.4 R\_TSIP\_AesXXxEcbEncryptInit**

---

**Format**

- ```
(1) #include "r_tsip_rx_if.h"
    e_tsip_err_t R_TSIP_Aes128EcbEncryptInit(
        tsip_aes_handle_t *handle,
        tsip_aes_key_index_t *key_index
    )

(2) #include "r_tsip_rx_if.h"
    e_tsip_err_t R_TSIP_Aes256EcbEncryptInit(
        tsip_aes_handle_t *handle,
        tsip_aes_key_index_t *key_index
    )
```

Parameters

handle	Output	AES handler (work area)
key_index	Input	Wrapped key

Return Values

TSIP_SUCCESS:	Normal termination
TSIP_ERR_FAIL:	Occurrence of internal error (Only for TSIP)
TSIP_ERR_RESOURCE_CONFLICT:	Occurrence of resource conflict because a hardware resource needed by the processing routine was in use by another processing routine
TSIP_ERR_KEY_SET:	Invalid wrapped key input

Description

The R_TSIP_AesXXxEcbEncryptInit() function performs preparations for the execution of AES calculation and writes the result to the first parameter, handle. The parameter handle is used subsequently as a parameter by the R_TSIP_AesXXxEcbEncryptUpdate() and R_TSIP_AesXXxEcbEncryptFinal() functions.

Refer to 3.7.1, Key Injection and Updating, for an explanation of how to generate key_index.

Reentrancy

Not supported.

4.2.3.5 R_TSIP_AesXXxEcbEncryptUpdate

Format

- ```
(1) #include "r_tsip_rx_if.h"
 e_tsip_err_t R_TSIP_Aes128EcbEncryptUpdate(
 tsip_aes_handle_t *handle,
 uint8_t *plain,
 uint8_t *cipher,
 uint32_t plain_length
)

(2) #include "r_tsip_rx_if.h"
 e_tsip_err_t R_TSIP_Aes256EcbEncryptUpdate(
 tsip_aes_handle_t *handle,
 uint8_t *plain,
 uint8_t *cipher,
 uint32_t plain_length
)
```

##### Parameters

|              |              |                                                           |
|--------------|--------------|-----------------------------------------------------------|
| handle       | Input/output | AES handler (work area)                                   |
| plain        | Input        | Plaintext data area                                       |
| cipher       | Output       | Ciphertext data area                                      |
| plain_length | Input        | Byte length of plaintext data (Must be a multiple of 16.) |

##### Return Values

|                             |                         |
|-----------------------------|-------------------------|
| TSIP_SUCCESS:               | Normal termination      |
| TSIP_ERR_PARAMETER:         | Invalid handle input    |
| TSIP_ERR_PROHIBIT_FUNCTION: | Invalid function called |

##### Description

Using the handle specified by the first parameter, handle, the R\_TSIP\_AesXXxEcbEncryptUpdate() function encrypts the second parameter, plain, using the key index specified by the R\_TSIP\_AesXXxEcbEncryptInit() function, and writes the encrypted result to the third parameter, cipher. After plaintext input completes, call R\_TSIP\_AesXXxEcbEncryptFinal().

Except in cases where the addresses are the same, specify areas for plain and cipher that do not overlap.

##### Reentrancy

Not supported.

**4.2.3.6 R\_TSIP\_AesXXxEcbEncryptFinal****Format**

- ```
(1) #include "r_tsip_rx_if.h"
    e_tsip_err_t R_TSIP_Aes128EcbEncryptFinal(
        tsip_aes_handle_t *handle,
        uint8_t *cipher,
        uint32_t *cipher_length
    )

(2) #include "r_tsip_rx_if.h"
    e_tsip_err_t R_TSIP_Aes256EcbEncryptFinal(
        tsip_aes_handle_t *handle,
        uint8_t *cipher,
        uint32_t *cipher_length
    )
```

Parameters

handle	Input	AES handler (work area)
cipher	Output	Ciphertext data area (Nothing is ever written here.)
cipher_length	Output	Ciphertext data length (The write value is always 0.)

Return Values

TSIP_SUCCESS:	Normal termination
TSIP_ERR_FAIL:	Occurrence of internal error
TSIP_ERR_PARAMETER:	Invalid handle input
TSIP_ERR_PROHIBIT_FUNCTION:	Invalid function called

Description

Using the handle specified by the first parameter, handle, the R_TSIP_AesXXxEcbEncryptFinal() function writes the calculation result to the second parameter, cipher, and writes the length of the calculation result to the third parameter, cipher_length. The original intent was for any portion of the encrypted result that was not a multiple of 16 bytes to be written to the second parameter. However, due to the restriction that only multiples of 16 can be input to the R_TSIP_AesXXxEcbEncryptUpdate() function, nothing is ever written to cipher, and 0 is always written to cipher_length. The parameters cipher and cipher_length are provided for future compatibility in anticipation of this restriction eventually being removed.

Reentrancy

Not supported.

4.2.3.7 R_TSIP_AesXXxEcbDecryptInit

Format

- ```
(1) #include "r_tsip_rx_if.h"
 e_tsip_err_t R_TSIP_Aes128EcbDecryptInit(
 tsip_aes_handle_t *handle,
 tsip_aes_key_index_t *key_index
)
(2) #include "r_tsip_rx_if.h"
 e_tsip_err_t R_TSIP_Aes256EcbDecryptInit(
 tsip_aes_handle_t *handle,
 tsip_aes_key_index_t *key_index
)
```

**Parameters**

|           |        |                         |
|-----------|--------|-------------------------|
| handle    | Output | AES handler (work area) |
| key_index | Input  | Wrapped key             |

**Return Values**

|                             |                                                                                                                                       |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| TSIP_SUCCESS:               | Normal termination                                                                                                                    |
| TSIP_ERR_FAIL:              | Occurrence of internal error (Only for TSIP)                                                                                          |
| TSIP_ERR_RESOURCE_CONFLICT: | Occurrence of resource conflict because a hardware resource needed by the processing routine was in use by another processing routine |
| TSIP_ERR_KEY_SET:           | Invalid wrapped key input                                                                                                             |

**Description**

The R\_TSIP\_AesXXxEcbDecryptInit() function performs preparations for the execution of AES calculation and writes the result to the first parameter, handle. The parameter handle is used subsequently as a parameter by the R\_TSIP\_AesXXxEcbDecryptUpdate() and R\_TSIP\_AesXXxEcbDecryptFinal() functions. Refer to 3.7.1, Key Injection and Updating, for an explanation of how to generate key\_index.

**Reentrancy**

Not supported.

**4.2.3.8 R\_TSIP\_AesXXxEcbDecryptUpdate****Format**

- ```
(1) #include "r_tsip_rx_if.h"
    e_tsip_err_t R_TSIP_Aes128EcbDecryptUpdate(
        tsip_aes_handle_t *handle,
        uint8_t *cipher,
        uint8_t *plain,
        uint32_t cipher_length
    )

(2) #include "r_tsip_rx_if.h"
    e_tsip_err_t R_TSIP_Aes256EcbDecryptUpdate(
        tsip_aes_handle_t *handle,
        uint8_t *cipher,
        uint8_t *plain,
        uint32_t cipher_length
    )
```

Parameters

handle	Input/output	AES handler (work area)
cipher	Input	Ciphertext data area
plain	Output	Plaintext data area
cipher_length	Input	Byte length of ciphertext data (Must be a multiple of 16.)

Return Values

TSIP_SUCCESS:	Normal termination
TSIP_ERR_PARAMETER:	Invalid handle input
TSIP_ERR_PROHIBIT_FUNCTION:	Invalid function called

Description

Using the handle specified by the first parameter, handle, the R_TSIP_AesXXxEcbDecryptUpdate() function decrypts the second parameter, cipher, using the key index specified by the R_TSIP_AesXXxEcbDecryptInit() function, and writes the decrypted result to the third parameter, plain. After ciphertext input completes, call R_TSIP_AesXXxEcbDecryptFinal().

Except in cases where the addresses are the same, specify areas for plain and cipher that do not overlap.

Reentrancy

Not supported.

4.2.3.9 R_TSIP_AesXXxEcbDecryptFinal**Format**

- ```
(1) #include "r_tsip_rx_if.h"
 e_tsip_err_t R_TSIP_Aes128EcbDecryptFinal(
 tsip_aes_handle_t *handle,
 uint8_t *plain,
 uint32_t *plain_length
)

(2) #include "r_tsip_rx_if.h"
 e_tsip_err_t R_TSIP_Aes256EcbDecryptFinal(
 tsip_aes_handle_t *handle,
 uint8_t *plain,
 uint32_t *plain_length
)
```

**Parameters**

|              |        |                                                      |
|--------------|--------|------------------------------------------------------|
| handle       | Input  | AES handler (work area)                              |
| plain        | Output | Plaintext data area (Nothing is ever written here.)  |
| plain_length | Output | Plaintext data length (The write value is always 0.) |

**Return Values**

|                             |                              |
|-----------------------------|------------------------------|
| TSIP_SUCCESS:               | Normal termination           |
| TSIP_ERR_FAIL:              | Occurrence of internal error |
| TSIP_ERR_PARAMETER:         | Invalid handle input         |
| TSIP_ERR_PROHIBIT_FUNCTION: | Invalid function called      |

**Description**

Using the handle specified by the first parameter, handle, the R\_TSIP\_AesXXxEcbDecryptFinal() function writes the calculation result to the second parameter, plain, and writes the length of the calculation result to the third parameter, plain\_length. The original intent was for any portion of the decrypted result that was not a multiple of 16 bytes to be written to the second parameter. However, due to the restriction that only multiples of 16 can be input to the R\_TSIP\_AesXXxEcbDecryptUpdate() function, nothing is ever written to plain, and 0 is always written to plain\_length. The parameters plain and plain\_length are provided for future compatibility in anticipation of this restriction eventually being removed.

**Reentrancy**

Not supported.

**4.2.3.10 R\_TSIP\_AesXXxCbcEncryptInit****Format**

| key_index | Input  | Wrapped key                      |
| ivec      | Input  | Initialization vector (16 bytes) |

**Return Values**

|                             |                                                                                                                                       |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| TSIP_SUCCESS:               | Normal termination                                                                                                                    |
| TSIP_ERR_FAIL:              | Occurrence of internal error (Only for TSIP)                                                                                          |
| TSIP_ERR_RESOURCE_CONFLICT: | Occurrence of resource conflict because a hardware resource needed by the processing routine was in use by another processing routine |
| TSIP_ERR_KEY_SET:           | Invalid wrapped key input                                                                                                             |

**Description**

The R\_TSIP\_AesXXxCbcEncryptInit() function performs preparations for the execution of AES calculation, and writes the result to the first parameter, handle. The parameter handle is used subsequently as a parameter by the R\_TSIP\_AesXXxCbcEncryptUpdate() and R\_TSIP\_AesXXxCbcEncryptFinal() functions.

When using the TLS cooperation function, input client\_crypto\_key\_index or server\_crypto\_key\_index, generated by R\_TSIP\_TlsGenerateSessionKey(), as key\_index.

Refer to 3.7.1, Key Injection and Updating, for an explanation of how to generate key\_index.

**Reentrancy**

Not supported.

**4.2.3.11 R\_TSIP\_AesXXXCbcEncryptUpdate****Format**

- ```
(1) #include "r_tsip_rx_if.h"
    e_tsip_err_t R_TSIP_Aes128CbcEncryptUpdate(
        tsip_aes_handle_t *handle,
        uint8_t *plain,
        uint8_t *cipher,
        uint32_t plain_length
    )

(2) #include "r_tsip_rx_if.h"
    e_tsip_err_t R_TSIP_Aes256CbcEncryptUpdate(
        tsip_aes_handle_t *handle,
        uint8_t *plain,
        uint8_t *cipher,
        uint32_t plain_length
    )
```

Parameters

handle	Input/output	AES handler (work area)
plain	Input	Plaintext data area
cipher	Output	Ciphertext data area
plain_length	Input	Byte length of plaintext data (Must be a multiple of 16.)

Return Values

TSIP_SUCCESS:	Normal termination
TSIP_ERR_PARAMETER:	Invalid handle input
TSIP_ERR_PROHIBIT_FUNCTION:	Invalid function called

Description

Using the handle specified by the first parameter, handle, the R_TSIP_AesXXXCbcEncryptUpdate() function encrypts the second parameter, plain, using the key index specified by the R_TSIP_AesXXXCbcEncryptInit() function, and writes the encrypted result to the third parameter, cipher. After plaintext input completes, call R_TSIP_AesXXXCbcEncryptFinal().

Except in cases where the addresses are the same, specify areas for plain and cipher that do not overlap.

Reentrancy

Not supported.

4.2.3.12 R_TSIP_AesXXxCbcEncryptFinal**Format**

- ```
(1) #include "r_tsip_rx_if.h"
 e_tsip_err_t R_TSIP_Aes128CbcEncryptFinal(
 tsip_aes_handle_t *handle,

| TSIP_ERR_RESOURCE_CONFLICT: | Occurrence of resource conflict because a hardware resource needed by the processing routine was in use by another processing routine |
| TSIP_ERR_KEY_SET:           | Invalid wrapped key input                                                                                                             |

**Description**

The R\_TSIP\_AesXXxCbcDecryptInit() function performs preparations for the execution of AES calculation, and writes the result to the first parameter, handle. The parameter handle is used subsequently as a parameter by the R\_TSIP\_AesXXxCbcDecryptUpdate() and R\_TSIP\_AesXXxCbcDecryptFinal() functions.

When using the TLS cooperation function, input client\_crypto\_key\_index or server\_crypto\_key\_index, generated by R\_TSIP\_TlsGenerateSessionKey(), as key\_index.

Refer to 3.7.1, Key Injection and Updating, for an explanation of how to generate key\_index.

**Reentrancy**

Not supported.

**4.2.3.14 R\_TSIP\_AesXXXCbcDecryptUpdate****Format**

- ```
(1) #include "r_tsip_rx_if.h"
    e_tsip_err_t R_TSIP_Aes128CbcDecryptUpdate(
        tsip_aes_handle_t *handle,
        uint8_t *cipher,
        uint8_t *plain,
        uint32_t cipher_length
    )

(2) #include "r_tsip_rx_if.h"
    e_tsip_err_t R_TSIP_Aes256CbcDecryptUpdate(
        tsip_aes_handle_t *handle,
        uint8_t *cipher,
        uint8_t *plain,
        uint32_t cipher_length
    )
```

Parameters

handle	Input/output	AES handler (work area)
cipher	Input	Ciphertext data area
plain	Output	Plaintext data area
cipher_length	Input	Byte length of ciphertext data (Must be a multiple of 16.)

Return Values

TSIP_SUCCESS:	Normal termination
TSIP_ERR_PARAMETER:	Invalid handle input
TSIP_ERR_PROHIBIT_FUNCTION:	Invalid function called

Description

Using the handle specified by the first parameter, handle, the R_TSIP_AesXXXCbcDecryptUpdate() function decrypts the second parameter, cipher, utilizing the key index specified by the R_TSIP_AesXXXCbcDecryptInit() function, and writes the decrypted result to the third parameter, plain. After ciphertext input completes, call R_TSIP_AesXXXCbcDecryptFinal().

Except in cases where the addresses are the same, specify areas for plain and cipher that do not overlap.

Reentrancy

Not supported.

4.2.3.15 R_TSIP_AesXXxCbcDecryptFinal**Format**

- ```
(1) #include "r_tsip_rx_if.h"
 e_tsip_err_t R_TSIP_Aes128CbcDecryptFinal(
 tsip_aes_handle_t *handle,
 uint8_t *plain,
 uint32_t *plain_length
)

(2) #include "r_tsip_rx_if.h"
 e_tsip_err_t R_TSIP_Aes256CbcDecryptFinal(
 tsip_aes_handle_t *handle,
 uint8_t *plain,
 uint32_t *plain_length
)
```

**Parameters**

|              |        |                                                      |
|--------------|--------|------------------------------------------------------|
| handle       | Input  | AES handler (work area)                              |
| plain        | Output | Plaintext data area (Nothing is ever written here.)  |
| plain_length | Output | Plaintext data length (The write value is always 0.) |

**Return Values**

|                             |                              |
|-----------------------------|------------------------------|
| TSIP_SUCCESS:               | Normal termination           |
| TSIP_ERR_FAIL:              | Occurrence of internal error |
| TSIP_ERR_PARAMETER:         | Invalid handle input         |
| TSIP_ERR_PROHIBIT_FUNCTION: | Invalid function called      |

**Description**

Using the handle specified by the first parameter, handle, the R\_TSIP\_AesXXxCbcDecryptFinal() function writes the calculation result to the second parameter, plain, and writes the length of the calculation result to the third parameter, plain\_length. The original intent was for any portion of the decrypted result that was not a multiple of 16 bytes to be written to the second parameter. However, due to the restriction that only multiples of 16 can be input to the R\_TSIP\_AesXXxCbcDecryptUpdate() function, nothing is ever written to plain, and 0 is always written to plain\_length. The parameters plain and plain\_length are provided for future compatibility in anticipation of this restriction eventually being removed.

**Reentrancy**

Not supported.

)

```

**Parameters**

|           |        |                            |
|-----------|--------|----------------------------|
| handle    | Output | AES handler (work area)    |
| key_index | Input  | Wrapped key                |
| ictr      | Input  | Initial counter (16 bytes) |

**Return Values**

|                             |                                                                                                                                       |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| TSIP_SUCCESS:               | Normal termination                                                                                                                    |
| TSIP_ERR_FAIL:              | Occurrence of internal error (Only for TSIP)                                                                                          |
| TSIP_ERR_RESOURCE_CONFLICT: | Occurrence of resource conflict because a hardware resource needed by the processing routine was in use by another processing routine |
| TSIP_ERR_KEY_SET:           | Invalid wrapped key input                                                                                                             |

**Description**

This function performs preparations for the execution of an AES calculation and writes the result to the parameter handle. The parameter handle is used subsequently as a parameter by the R\_TSIP\_AesXXXCtrlUpdate() and R\_TSIP\_AesXXXCtrlFinal() functions.

Refer to 3.7.1, Key Injection and Updating, for an explanation of how to generate key\_index.

**Reentrancy**

Not supported.

**4.2.3.17 R\_TSIP\_AesXXXCtrUpdate****Format**

- ```
(1) #include "r_tsip_rx_if.h"
    e_tsip_err_t R_TSIP_Aes128CtrUpdate(
        tsip_aes_handle_t *handle,
        uint8_t *itext,
        uint8_t *otext,
        uint32_t itext_length
    )

(2) #include "r_tsip_rx_if.h"
    e_tsip_err_t R_TSIP_Aes256CtrUpdate(
        tsip_aes_handle_t *handle,
        uint8_t *itext,
        uint8_t *otext,
        uint32_t itext_length
    )
```

Parameters

handle	Input/output	AES handler (work area)
itext	Input	Input text (plaintext or ciphertext) data area
otext	Output	Output text (ciphertext or plaintext) data area
itext_length	Input	Byte length of input text data (Must be a multiple of 16.)

Return Values

TSIP_SUCCESS:	Normal termination
TSIP_ERR_PARAMETER:	Invalid handle input
TSIP_ERR_PROHIBIT_FUNCTION:	Invalid function called

Description

Using the handle specified by the first parameter, handle, this function encrypts the second parameter, itext, utilizing key_index specified by the R_TSIP_AesXXXCtrlInit() function, and writes the result to the third parameter, otext. After input of the final block completes, call R_TSIP_AesXXXCtrFinal(). If the length of the last block is 1 to 127 bits, allocate areas in 16-byte units for itext and otext, and set an arbitrary value for the fractional remainder area of itext. In this case, ignore the value stored in the fractional remainder area of otext.

Except in cases where the addresses are the same, specify areas for itext and otext that do not overlap.

Reentrancy

Not supported.

4.2.3.18 R_TSIP_AesXXXCtrFinal

Format

- ```
(1) #include "r_tsip_rx_if.h"
 e_tsip_err_t R_TSIP_Aes128CtrFinal(
 tsip_aes_handle_t *handle
)
(2) #include "r_tsip_rx_if.h"
 e_tsip_err_t R_TSIP_Aes256CtrFinal(
 tsip_aes_handle_t *handle
)
```

**Parameters**

|        |       |                         |
|--------|-------|-------------------------|
| handle | Input | AES handler (work area) |
|--------|-------|-------------------------|

**Return Values**

|                             |                              |
|-----------------------------|------------------------------|
| TSIP_SUCCESS:               | Normal termination           |
| TSIP_ERR_FAIL:              | Occurrence of internal error |
| TSIP_ERR_PARAMETER:         | Invalid handle input         |
| TSIP_ERR_PROHIBIT_FUNCTION: | Invalid function called      |

**Description**

Using the handle specified by the first parameter, handle, this function completes the calculation.

**Reentrancy**

Not supported.

**4.2.3.19 R\_TSIP\_AesXXXGcmEncryptInit****Format**

```

(1) #include "r_tsip_rx_if.h"
 e_tsip_err_t R_TSIP_Aes128GcmEncryptInit(
 tsip_gcm_handle_t *handle,
 tsip_aes_key_index_t *key_index,
 uint8_t *ivec,
 uint32_t ivec_len
)

(2) #include "r_tsip_rx_if.h"
 e_tsip_err_t R_TSIP_Aes256GcmEncryptInit(
 tsip_gcm_handle_t *handle,
 tsip_aes_key_index_t *key_index,
 uint8_t *ivec,
 uint32_t ivec_len
)

```

**Parameters**

|           |        |                                                         |
|-----------|--------|---------------------------------------------------------|
| handle    | Output | AES-GCM handler (work area)                             |
| key_index | Input  | Wrapped key                                             |
| ivec      | Input  | Initialization vector area (iv_len bytes)* <sup>1</sup> |
| ivec_len  | Input  | Initialization vector length (1 or more bytes)          |

**Return Values**

|                             |                                                                                                                                       |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| TSIP_SUCCESS:               | Normal termination                                                                                                                    |
| TSIP_ERR_FAIL:              | Occurrence of internal error                                                                                                          |
| TSIP_ERR_RESOURCE_CONFLICT: | Occurrence of resource conflict because a hardware resource needed by the processing routine was in use by another processing routine |
| TSIP_ERR_KEY_SET:           | Invalid wrapped key input                                                                                                             |
| TSIP_ERR_PARAMETER:         | Invalid input data                                                                                                                    |

**Description**

The R\_TSIP\_AesXXXGcmEncryptInit() function performs preparations for the execution of GCM calculation and writes the result to the first parameter, handle. The parameter handle is used subsequently as a parameter by the R\_TSIP\_AesXXX1GcmEncryptUpdate() and R\_TSIP\_AesXXXGcmEncryptFinal() functions.

Note: 1. When key\_index->type is TSIP\_KEY\_INDEX\_TYPE\_AES128\_FOR\_TLS  
The key\_index value generated by the R\_TSIP\_TlsGenerateSessionKey() function includes a 96-bit IV when a value of 6 or 7 has been specified for select\_cipher. In this case, input a null pointer as the third parameter, ivec, and specify 0 as the fourth parameter, ivec\_len.

Refer to 3.7.1, Key Injection and Updating, for an explanation of how to generate key\_index.

**Reentrancy**

Not supported.

**4.2.3.20 R\_TSIP\_AesXXXGcmEncryptUpdate****Format**

```

(1) #include "r_tsip_rx_if.h"
 e_tsip_err_t R_TSIP_Aes128GcmEncryptUpdate(
 tsip_gcm_handle_t *handle,
 uint8_t *plain,
 uint8_t *cipher,
 uint32_t plain_data_len,
 uint8_t *aad,
 uint32_t aad_len
)

(2) #include "r_tsip_rx_if.h"
 e_tsip_err_t R_TSIP_Aes256GcmEncryptUpdate(
 tsip_gcm_handle_t *handle,
 uint8_t *plain,
 uint8_t *cipher,
 uint32_t plain_data_len,
 uint8_t *aad,
 uint32_t aad_len
)

```

**Parameters**

|                |              |                                                           |
|----------------|--------------|-----------------------------------------------------------|
| handle         | Input/output | AES handler (work area)                                   |
| plain          | Input        | Plaintext data area                                       |
| cipher         | Output       | Ciphertext data area                                      |
| plain_data_len | Input        | Byte length of plaintext data (Must be a multiple of 16.) |
| aad            | Input        | AAD (aad_len bytes)                                       |
| aad_len        | Input        | AAD length (0 or more bytes)                              |

**Return Values**

|                             |                         |
|-----------------------------|-------------------------|
| TSIP_SUCCESS:               | Normal termination      |
| TSIP_ERR_PARAMETER:         | Invalid handle input    |
| TSIP_ERR_PROHIBIT_FUNCTION: | Invalid function called |

**Description**

The R\_TSIP\_Aes128GcmEncryptUpdate() function encrypts the plaintext specified by the second parameter, plain, in GCM mode using the values specified for key\_index and ivec in R\_TSIP\_Aes128GcmEncryptInit() and the value specified by the fifth parameter, aad. The function internally buffers the data input by the user until the input values of aad and plain exceed 16 bytes. Once the input data from plain reaches 16 bytes or more, the encrypted result is output to the area specified by the third parameter, cipher. The lengths of the plain and aad data to be input are specified by the fourth parameter, plain\_data\_len, and the sixth parameter, aad\_len, respectively. For these, specify not the total byte count for the aad and plain input data, but rather the data length to be input when the user calls this function. If the input values of plain and aad are not divisible by 16 bytes, the function performs padding internally. First process the data to be input as aad, and then the data to be input as plain. If aad data is input after starting to input plain data, a root error occurs. If aad data and plain data are input to the function at the same time, the aad data is processed, and then the function transitions to the plain data input state. Except in cases where the addresses are the same, specify areas for plain and cipher that do not overlap.

**Reentrancy**

Not supported.

**4.2.3.21 R\_TSIP\_AesXXXGcmEncryptFinal****Format**

```

(1) #include "r_tsip_rx_if.h"
 e_tsip_err_t R_TSIP_Aes128GcmEncryptFinal(
 tsip_gcm_handle_t *handle,
 uint8_t *cipher,
 uint32_t *cipher_data_len,
 uint8_t *atag
)
(2) #include "r_tsip_rx_if.h"
 e_tsip_err_t R_TSIP_Aes256GcmEncryptFinal(
 tsip_gcm_handle_t *handle,
 uint8_t *cipher,
 uint32_t *cipher_data_len,
 uint8_t *atag
)

```

**Parameters**

|                 |        |                                                       |
|-----------------|--------|-------------------------------------------------------|
| handle          | Input  | AES handler (work area)                               |
| cipher          | Output | Ciphertext data area (Nothing is ever written here.)  |
| cipher_data_len | Output | Ciphertext data length (The write value is always 0.) |
| atag            | Output | Authentication tag area (16 bytes)                    |

**Return Values**

|                             |                              |
|-----------------------------|------------------------------|
| TSIP_SUCCESS:               | Normal termination           |
| TSIP_ERR_FAIL:              | Occurrence of internal error |
| TSIP_ERR_PARAMETER:         | Invalid handle input         |
| TSIP_ERR_PROHIBIT_FUNCTION: | Invalid function called      |

**Description**

If there is 16-byte fractional remainder data indicated by the total data length of the value of plain input to R\_TSIP\_AesXXXGcmEncryptUpdate(), the R\_TSIP\_AesXXXGcmEncryptFinal() function outputs the result of encrypting the fractional remainder data to the area specified by the second parameter, cipher. In this case, the portion short of 16 bytes is padded with zeros. The authentication tag is output as the fourth parameter, atag.

**Reentrancy**

Not supported.

| aad_len         | Input        | AAD length (0 or more bytes)             |

**Return Values**

|                             |                         |
|-----------------------------|-------------------------|
| TSIP_SUCCESS:               | Normal termination      |
| TSIP_ERR_PARAMETER:         | Invalid handle input    |
| TSIP_ERR_PROHIBIT_FUNCTION: | Invalid function called |

**Description**

The R\_TSIP\_AesXXXGcmDecryptUpdate() function decrypts the ciphertext specified by the second parameter, cipher, in GCM mode using the values specified for key\_index and ivec in R\_TSIP\_AesXXXGcmDecryptInit() and the value specified by the fifth parameter, aad. The function internally buffers the data input by the user until the input values of aad and cipher exceed 16 bytes. Once the input data from cypher reaches 16 bytes or more, the decrypted result is output to the area specified by the third parameter, plain. The lengths of the cipher and aad data to be input are specified by the fourth parameter, cipher\_data\_len, and the sixth parameter, aad\_len, respectively. For these, specify not the total byte count for the aad and cipher input data, but rather the data length to be input when the user calls this function. If the input values of cipher and aad are not divisible by 16 bytes, the function performs padding internally. Inside of this API, the state is transited from aad data input state to cipher data input state. Although the aad data and cipher data can be input simultaneously, the last data of aad data must be input when cipher data is input. Except in cases where the addresses are the same, specify areas for plain and cipher that do not overlap.

**Reentrancy.**

Not supported.

**4.2.3.24 R\_TSIP\_AesXXXGcmDecryptFinal****Format**

```

(1) #include "r_tsip_rx_if.h"

 uint8_t *atag,
 uint32_t atag_len
)

```

**Parameters**

|                |        |                                                               |
|----------------|--------|---------------------------------------------------------------|
| handle         | Input  | AES-GCM handler (work area)                                   |
| plain          | Output | Plaintext data area (data_len bytes)                          |
| plain_data_len | Output | Plaintext data length (0 or more bytes)                       |
| atag           | Input  | Authentication tag area (atag_len bytes)                      |
| atag_len       | Input  | Authentication tag length (4, 8, 12, 13, 14, 15, or 16 bytes) |

**Return Values**

|                             |                              |
|-----------------------------|------------------------------|
| TSIP_SUCCESS:               | Normal termination           |
| TSIP_ERR_FAIL:              | Occurrence of internal error |
| TSIP_ERR_AUTHENTICATION:    | Authentication error         |
| TSIP_ERR_PROHIBIT_FUNCTION: | Invalid function called      |
| TSIP_ERR_PARAMETER:         | Invalid input data           |

**Description**

The R\_TSIP\_AesXXXGcmDecryptFinal() function decrypts, in GCM mode, the fractional remainder of the ciphertext specified by R\_TSIP\_AesXXXGcmDecryptUpdate() that does not reach 16 bytes, and then terminates GCM decryption functionality. The decrypted data and authentication tag are output to the area specified by the second parameter, plain, and the area specified as the fourth parameter, atag, respectively. The total data length of the decrypted data is output to the third parameter, plain\_data\_len. If authentication fails, a value of TSIP\_ERR\_AUTHENTICATION is returned. For the fourth parameter, atag, input 16 bytes or less. If the data input is less than 16 bytes, it is padded with zeros by the function internally.

**Reentrancy**

Not supported.

**4.2.3.25 R\_TSIP\_AesXXXCcmEncryptInit****Format**

```

(1) #include "r_tsip_rx_if.h"

| TSIP_ERR_FAIL:              | Occurrence of internal error                                                                                                          |
| TSIP_ERR_RESOURCE_CONFLICT: | Occurrence of resource conflict because a hardware resource needed by the processing routine was in use by another processing routine |
| TSIP_ERR_KEY_SET:           | Invalid wrapped key input                                                                                                             |

**Description**

R\_TSIP\_AesXXXCcmEncryptInit() function performs preparations for the execution of CCM calculation and writes the result to the first parameter, handle. The parameter handle is used subsequently as a parameter by the R\_TSIP\_AesXXXCcmEncryptUpdate() and R\_TSIP\_AesXXXCcmEncryptFinal() functions.

Refer to 3.7.1, Key Injection and Updating, for an explanation of how to generate key\_index.

**Reentrancy**

Not supported.

**4.2.3.26 R\_TSIP\_AesXXXCcmEncryptUpdate****Format**

```

(1) #include "r_tsip_rx_if.h"
 e_tsip_err_t R_TSIP_Aes128CcmEncryptUpdate(
 tsip_ccm_handle_t *handle,
 uint8_t *plain,
 uint8_t *cipher,
 uint32_t plain_length
)
(2) #include "r_tsip_rx_if.h"
 e_tsip_err_t R_TSIP_Aes256CcmEncryptUpdate(
 tsip_ccm_handle_t *handle,
 uint8_t *plain,
 uint8_t *cipher,
 uint32_t plain_length
)

```

**Parameters**

|              |              |                         |
|--------------|--------------|-------------------------|
| handle       | Input/output | AES handler (work area) |
| plain        | Input        | Plaintext data area     |
| cipher       | Output       | Ciphertext data area    |
| plain_length | Input        | Plaintext data length   |

**Return Values**

|                             |                         |
|-----------------------------|-------------------------|
| TSIP_SUCCESS:               | Normal termination      |
| TSIP_ERR_PARAMETER:         | Invalid handle input    |
| TSIP_ERR_PROHIBIT_FUNCTION: | Invalid function called |

**Description**

The R\_TSIP\_AesXXXCcmEncryptUpdate() function encrypts the plaintext specified in the second argument, plain, in CCM mode using the values specified by key\_index, nonce, and adata in R\_TSIP\_AesXXXCcmEncryptInit(). This function buffers internally the data input by the user until the input value of plain exceeds 16 bytes. Once the amount of plain input data is 16 bytes or greater, the encrypted result is output to cipher, which is specified in the third argument. Use payload\_len in R\_TSIP\_AesXXXCcmEncryptInit() to specify the total data length of plain that will be input. Use plain\_length in this function to specify the data length to be input when the user calls this function. If the input value of plain is less than 16 bytes, the function performs padding internally. Except in cases where the addresses are the same, specify areas for plain and cipher that do not overlap.

**Reentrancy**

Not supported.

**4.2.3.27 R\_TSIP\_AesXXXCcmEncryptFinal****Format**

```

(1) #include "r_tsip_rx_if.h"
 e_tsip_err_t R_TSIP_Aes128CcmEncryptFinal(
 tsip_ccm_handle_t *handle,
 uint8_t *cipher,
 uint32_t *cipher_length,
 uint8_t *mac,
 uint32_t mac_length
)

(2) #include "r_tsip_rx_if.h"
 e_tsip_err_t R_TSIP_Aes256CcmEncryptFinal(
 tsip_ccm_handle_t *handle,
 uint8_t *cipher,
 uint32_t *cipher_length,
 uint8_t *mac,
 uint32_t mac_length
)

```

**Parameters**

|               |        |                                                       |
|---------------|--------|-------------------------------------------------------|
| handle        | Input  | AES handler (work area)                               |
| cipher        | Output | Ciphertext data area (Nothing is ever written here.)  |
| cipher_length | Output | Ciphertext data length (The write value is always 0.) |
| mac           | Output | MAC area                                              |
| mac_length    | Input  | MAC length (4, 6, 8, 10, 12, 14, or 16 bytes)         |

**Return Values**

|                             |                              |
|-----------------------------|------------------------------|
| TSIP_SUCCESS:               | Normal termination           |
| TSIP_ERR_FAIL:              | Occurrence of internal error |
| TSIP_ERR_PARAMETER:         | Invalid handle input         |
| TSIP_ERR_PROHIBIT_FUNCTION: | Invalid function called      |

**Description**

If there is 16-byte fractional remainder data indicated by the total data length of the value of plain input to R\_TSIP\_AesXXXCcmEncryptUpdate(), the R\_TSIP\_AesXXXCcmEncryptFinal() function outputs the result of encrypting the fractional remainder data to the area specified by the second parameter, cipher. The MAC value is output to the fourth parameter, mac. Set the fifth parameter, mac\_length, to the same value as that specified for the parameter mac\_length in R\_TSIP\_AesXXXCcmEncryptInit().

**Reentrancy**

Not supported.

**4.2.3.28 R\_TSIP\_AesXXXCcmDecryptInit****Format**

```

(1) #include "r_tsip_rx_if.h"

| TSIP_ERR_FAIL:              | Occurrence of internal error                                                                                                          |
| TSIP_ERR_RESOURCE_CONFLICT: | Occurrence of resource conflict because a hardware resource needed by the processing routine was in use by another processing routine |
| TSIP_ERR_KEY_SET:           | Invalid wrapped key input                                                                                                             |

**Description**

R\_TSIP\_AesXXXCcmDecryptInit() function performs preparations for the execution of CCM calculation and writes the result to the first parameter, handle. The parameter handle is used subsequently as a parameter by the R\_TSIP\_AesXXXCcmDecryptUpdate() and R\_TSIP\_AesXXXCcmDecryptFinal() functions.

Refer to 3.7.1, Key Injection and Updating, for an explanation of how to generate key\_index.

**Reentrancy**

Not supported.

**4.2.3.29 R\_TSIP\_AesXXXCcmDecryptUpdate****Format**

```

(1) #include "r_tsip_rx_if.h"
 e_tsip_err_t R_TSIP_Aes128CcmDecryptUpdate(
 tsip_ccm_handle_t *handle,
 uint8_t *cipher,
 uint8_t *plain,
 uint32_t cipher_length
)
(2) #include "r_tsip_rx_if.h"
 e_tsip_err_t R_TSIP_Aes256CcmDecryptUpdate(
 tsip_ccm_handle_t *handle,
 uint8_t *cipher,
 uint8_t *plain,
 uint32_t cipher_length
)

```

**Parameters**

|               |              |                             |
|---------------|--------------|-----------------------------|
| handle        | Input/output | AES-CCM handler (work area) |
| cipher        | Input        | Ciphertext data area        |
| plain         | Output       | Plaintext data area         |
| cipher_length | Input        | Ciphertext data length      |

**Return Values**

|                             |                         |
|-----------------------------|-------------------------|
| TSIP_SUCCESS:               | Normal termination      |
| TSIP_ERR_PARAMETER:         | Invalid handle input    |
| TSIP_ERR_PROHIBIT_FUNCTION: | Invalid function called |

**Description**

The R\_TSIP\_AesXXXCcmDecryptUpdate() function decrypts the ciphertext specified by the second parameter, cipher, in CCM mode using the values specified for key\_index, nonce, and adata in R\_TSIP\_AesXXXCcmDecryptInit(). The function internally buffers the data input by the user until the input value of cipher exceeds 16 bytes. Once the input data from cypher reaches 16 bytes or more, the decrypted result is output to the area specified by the third parameter, plain. Specify the total data length of the cipher data to be input in the payload\_len parameter of R\_TSIP\_AesXXXCcmDecryptInit(). For the cipher\_length parameter of this function, specify the data length to be input by the user when the function is called. If the input value of cipher is not divisible by 16 bytes, the function performs padding internally. Except in cases where the addresses are the same, specify areas for plain and cipher that do not overlap.

**Reentrancy**

Not supported.

**4.2.3.30 R\_TSIP\_AesXXXCcmDecryptFinal****Format**

- ```
(1) #include "r_tsip_rx_if.h"
    e_tsip_err_t R_TSIP_Aes128CcmDecryptFinal(
        tsip_ccm_handle_t *handle,
        uint8_t *plain,
        uint32_t *plain_length,
        uint8_t *mac,
        uint32_t mac_length
    )

(2) #include "r_tsip_rx_if.h"
    e_tsip_err_t R_TSIP_Aes256CcmDecryptFinal(
        tsip_ccm_handle_t *handle,
        uint8_t *plain,
        uint32_t *plain_length,
        uint8_t *mac,
        uint32_t mac_length
    )
```

Parameters

handle	Input	AES-GCM handler (work area)
plain	Output	Plaintext data area
plain_length	Output	Plaintext data length
mac	Input	MAC area
mac_length	Input	MAC length (4, 6, 8, 10, 12, 14, or 16 bytes)

Return Values

TSIP_SUCCESS:	Normal termination
TSIP_ERR_FAIL:	Occurrence of internal error
TSIP_ERR_PARAMETER:	Invalid handle input
TSIP_ERR_PROHIBIT_FUNCTION:	Invalid function called

Description

If the data length of cipher input in R_TSIP_AesXXXCcmDecryptUpdate() results in a fractional remainder after 16 bytes, the R_TSIP_AesXXXCcmDecryptFinal() function outputs the leftover decrypted data to the second parameter, cipher. In addition, the function verifies the fourth parameter, mac. Set the fifth parameter, mac_length, to the same value as that specified for the parameter mac_length in R_TSIP_AesXXXCcmDecryptInit().

Reentrancy

Not supported.

4.2.3.31 R_TSIP_AesXXXCmacGenerateInit**Format**

```

(1) #include "r_tsip_rx_if.h"
    e_tsip_err_t R_TSIP_Aes128CmacGenerateInit(
        tsip_cmac_handle_t *handle,
        tsip_aes_key_index_t *key_index
    )
(2) #include "r_tsip_rx_if.h"
    e_tsip_err_t R_TSIP_Aes256CmacGenerateInit(
        tsip_cmac_handle_t *handle,
        tsip_aes_key_index_t *key_index
    )

```

Parameters

handle	Output	AES-CMAC handler (work area)
key_index	Input	Wrapped key

Return Values

TSIP_SUCCESS:	Normal termination
TSIP_ERR_FAIL:	Occurrence of internal error
TSIP_ERR_RESOURCE_CONFLICT:	Occurrence of resource conflict because a hardware resource needed by the processing routine was in use by another processing routine
TSIP_ERR_KEY_SET:	Invalid wrapped key input

Description

The R_TSIP_AesXXXCmacGenerateInit() function performs preparations for the execution of CMAC calculation, and writes the result to the first parameter, handle. The parameter handle is used subsequently as a parameter by the R_TSIP_AesXXXCmacGenerateUpdate() and R_TSIP_AesXXXCmacGenerateFinal() functions.

Refer to 3.7.1, Key Injection and Updating, for an explanation of how to generate key_index.

Reentrancy

Not supported.

4.2.3.32 R_TSIP_AesXXXCmacGenerateUpdate**Format**

```

(1) #include "r_tsip_rx_if.h"
    e_tsip_err_t R_TSIP_Aes128CmacGenerateUpdate(
        tsip_cmac_handle_t *handle,
        uint8_t *message,
        uint32_t message_length
    )
(2) #include "r_tsip_rx_if.h"
    e_tsip_err_t R_TSIP_Aes256CmacGenerateUpdate(
        tsip_cmac_handle_t *handle,
        uint8_t *message,
        uint32_t message_length
    )

```

Parameters

handle	Input/output	AES-CMAC handler (work area)
message	Input	Message data area (message_length bytes)
message_length	Input	Message data length (0 or more bytes)

Return Values

TSIP_SUCCESS:	Normal termination
TSIP_ERR_PARAMETER:	Invalid handle input
TSIP_ERR_PROHIBIT_FUNCTION:	Invalid function called

Description

The R_TSIP_AesXXXCmacGenerateUpdate() function generates a MAC value from the message specified as the second parameter, message, using the value specified for key_index in R_TSIP_AesXXXCmacGenerateInit(). The function internally buffers the data input by the user until the input value of message exceeds 16 bytes. The length of the message data to be input is specified by the third parameter, message_len. For this, specify not the total byte count for the message input data, but rather the message data length to be input when the user calls this function. If the input value, message, is not a multiple of 16 bytes, it is padded with zeros by the function internally.

Reentrancy

Not supported.

4.2.3.33 R_TSIP_AesXXXCmacGenerateFinal

Format

- ```
(1) #include "r_tsip_rx_if.h"
 e_tsip_err_t R_TSIP_Aes128CmacGenerateFinal(
 tsip_cmac_handle_t *handle,
 uint8_t *mac
)
(2) #include "r_tsip_rx_if.h"
 e_tsip_err_t R_TSIP_Aes256CmacGenerateFinal(
 tsip_cmac_handle_t *handle,
 uint8_t *mac
)
```

**Parameters**

|        |        |                              |
|--------|--------|------------------------------|
| handle | Input  | AES-CMAC handler (work area) |
| mac    | Output | MAC data area (16 bytes)     |

**Return Values**

|                             |                              |
|-----------------------------|------------------------------|
| TSIP_SUCCESS:               | Normal termination           |
| TSIP_ERR_FAIL:              | Occurrence of internal error |
| TSIP_ERR_PARAMETER:         | Invalid handle input         |
| TSIP_ERR_PROHIBIT_FUNCTION: | Invalid function called      |

**Description**

The R\_TSIP\_AesXXXCmacGenerateFinal() function outputs the MAC value to the MAC data area specified by the second parameter, mac, and then stops CMAC operation.

**Reentrancy**

Not supported.

**4.2.3.34 R\_TSIP\_AesXXXCmacVerifyInit****Format**

```

(1) #include "r_tsip_rx_if.h"
 e_tsip_err_t R_TSIP_Aes128CmacVerifyInit(
 tsip_cmac_handle_t *handle,
 tsip_aes_key_index_t *key_index
)
(2) #include "r_tsip_rx_if.h"
 e_tsip_err_t R_TSIP_Aes256CmacVerifyInit(
 tsip_cmac_handle_t *handle,
 tsip_aes_key_index_t *key_index
)

```

**Parameters**

|           |        |                              |
|-----------|--------|------------------------------|
| handle    | Output | AES-CMAC handler (work area) |
| key_index | Input  | Wrapped key                  |

**Return Values**

|                             |                                                                                                                                       |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| TSIP_SUCCESS:               | Normal termination                                                                                                                    |
| TSIP_ERR_FAIL:              | Occurrence of internal error                                                                                                          |
| TSIP_ERR_RESOURCE_CONFLICT: | Occurrence of resource conflict because a hardware resource needed by the processing routine was in use by another processing routine |
| TSIP_ERR_KEY_SET:           | Invalid wrapped key                                                                                                                   |

**Description**

The R\_TSIP\_AesXXXCmacVerifyInit() function performs preparations for the execution of CMAC calculation, and writes the result to the first parameter, handle. The parameter handle is used subsequently as a parameter by the R\_TSIP\_AesXXXCmacVerifyUpdate() and R\_TSIP\_AesXXXCmacVerifyFinal() functions.

Refer to 3.7.1, Key Injection and Updating, for an explanation of how to generate key\_index.

**Reentrancy**

Not supported.

**4.2.3.35 R\_TSIP\_AesXXXCmacVerifyUpdate****Format**

```

(1) #include "r_tsip_rx_if.h"
 e_tsip_err_t R_TSIP_Aes128CmacVerifyUpdate(
 tsip_cmac_handle_t *handle,
 uint8_t *message,
 uint32_t message_length
)
(2) #include "r_tsip_rx_if.h"
 e_tsip_err_t R_TSIP_Aes256CmacVerifyUpdate(
 tsip_cmac_handle_t *handle,
 uint8_t *message,
 uint32_t message_length
)

```

**Parameters**

|                |              |                                          |
|----------------|--------------|------------------------------------------|
| handle         | Input/output | AES-CMAC handler (work area)             |
| message        | Input        | Message data area (message_length bytes) |
| message_length | Input        | Message data length (0 or more bytes)    |

**Return Values**

|                             |                         |
|-----------------------------|-------------------------|
| TSIP_SUCCESS:               | Normal termination      |
| TSIP_ERR_PARAMETER:         | Invalid handle input    |
| TSIP_ERR_PROHIBIT_FUNCTION: | Invalid function called |

**Description**

The R\_TSIP\_AesXXXCmacVerifyUpdate() function generates a MAC value from the message specified as the second parameter, message, using the value specified for key\_index in R\_TSIP\_AesXXXCmacVerifyInit(). The function internally buffers the data input by the user until the input value of message exceeds 16 bytes. The length of the message data to be input is specified by the third parameter, message\_len. For this, specify not the total byte count for the message input data, but rather the message data length to be input when the user calls this function. If the input value, message, is not a multiple of 16 bytes, it is padded with zeros by the function internally.

**Reentrancy**

Not supported.

**4.2.3.36 R\_TSIP\_AesXXXCmacVerifyFinal****Format**

```

(1) #include "r_tsip_rx_if.h"
 e_tsip_err_t R_TSIP_Aes128CmacVerifyFinal(
 tsip_cmac_handle_t *handle,
 uint8_t *mac,
 uint32_t mac_length
)
(2) #include "r_tsip_rx_if.h"
 e_tsip_err_t R_TSIP_Aes256CmacVerifyFinal(
 tsip_cmac_handle_t *handle,
 uint8_t *mac,
 uint32_t mac_length
)

```

**Parameters**

|            |       |                                 |
|------------|-------|---------------------------------|
| handle     | Input | AES-CMAC handler (work area)    |
| mac        | Input | MAC data area (16 bytes)        |
| mac_length | Input | MAC data length (2 to 16 bytes) |

**Return Values**

|                             |                              |
|-----------------------------|------------------------------|
| TSIP_SUCCESS:               | Normal termination           |
| TSIP_ERR_FAIL:              | Occurrence of internal error |
| TSIP_ERR_AUTHENTICATION:    | Authentication failure       |
| TSIP_ERR_PARAMETER:         | Invalid handle input         |
| TSIP_ERR_PROHIBIT_FUNCTION: | Invalid function called      |

**Description**

The R\_TSIP\_AesXXXCmacVerifyFinal() function inputs the MAC value to the data area specified by the second parameter, mac, and verifies the MAC value. If authentication fails, a value of TSIP\_ERR\_AUTHENTICATION is returned. If the MAC value is less than 16 bytes, it is padded with zeros by the function internally.

**Reentrancy**

Not supported.

## 4.2.4 DES

### 4.2.4.1 R\_TSIP\_GenerateTdesKeyIndex

#### Format

```
#include "r_tsip_rx_if.h"
e_tsip_err_t R_TSIP_GenerateTdesKeyIndex(
 uint8_t *encrypted_provisioning_key,
 uint8_t *iv,
 uint8_t *encrypted_key,
 tsip_tdes_key_index_t *key_index
)
```

#### Parameters

|                            |        |                                                     |
|----------------------------|--------|-----------------------------------------------------|
| encrypted_provisioning_key | Input  | W-UFPK                                              |
| iv                         | Input  | Initialization vector when generating encrypted_key |
| encrypted_key              | Input  | Encrypted key encrypted using UFPK                  |
| key_index                  | Output | Wrapped key                                         |

#### Return Values

|                             |                                                                                                                                       |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| TSIP_SUCCESS:               | Normal termination                                                                                                                    |
| TSIP_ERR_RESOURCE_CONFLICT: | Occurrence of resource conflict because a hardware resource needed by the processing routine was in use by another processing routine |
| TSIP_ERR_FAIL:              | Occurrence of internal error                                                                                                          |

#### Description

This API outputs an DES wrapped key.

For encrypted\_key, input the data indicated in 7.3.2, DES, encrypted using the UFPK. Refer to 3.7.1, Key Injection and Updating, for an explanation of encrypted\_key, iv, and encrypted\_provisioning\_key and how to use key\_index.

#### Reentrancy

Not supported.

---

#### 4.2.4.2 R\_TSIP\_UpdateTdesKeyIndex

---

##### Format

```
#include "r_tsip_rx_if.h"
e_tsip_err_t R_TSIP_UpdateTdesKeyIndex(
 uint8_t *iv,
 uint8_t *encrypted_key,
 tsip_tdes_key_index_t *key_index
)
```

##### Parameters

|               |        |                                                     |
|---------------|--------|-----------------------------------------------------|
| iv            | Input  | Initialization vector when generating encrypted_key |
| encrypted_key | Input  | Encrypted key encrypted using KUK                   |
| key_index     | Output | Wrapped key                                         |

##### Return Values

|                             |                                                                                                                                       |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| TSIP_SUCCESS:               | Normal termination                                                                                                                    |
| TSIP_ERR_RESOURCE_CONFLICT: | Occurrence of resource conflict because a hardware resource needed by the processing routine was in use by another processing routine |
| TSIP_ERR_FAIL:              | Occurrence of internal error                                                                                                          |

##### Description

This API outputs a TDES wrapped key.

For encrypted\_key, input the data indicated in 7.3.2, DES, encrypted using the KUK. Refer to 3.7.1, Key Injection and Updating, for an explanation of iv and encrypted\_key and how to use key\_index.

##### Reentrancy

Not supported.

### 4.2.4.3 R\_TSIP\_GenerateTdesRandomKeyIndex

---

**Format**

```
#include "r_tsip_rx_if.h"
e_tsip_err_t R_TSIP_GenerateTdesRandomKeyIndex(
 tsip_tdes_key_index_t *key_index
)
```

**Parameters**

|           |        |             |
|-----------|--------|-------------|
| key_index | Output | Wrapped key |
|-----------|--------|-------------|

**Return Values**

|                             |                                                                                                                                       |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| TSIP_SUCCESS:               | Normal termination                                                                                                                    |
| TSIP_ERR_RESOURCE_CONFLICT: | Occurrence of resource conflict because a hardware resource needed by the processing routine was in use by another processing routine |

**Description**

This API outputs a TDES wrapped key.

This API generates a user key from a random number within the TSIP. Therefore, no user key needs to be input. Encrypting data using the wrapped key output by this API makes it possible to prevent dead copying of data.

Refer to 3.7.1, Key Injection and Updating, for an explanation of how to use key\_index.

**Reentrancy**

Not supported.

#### 4.2.4.4 R\_TSIP\_TdesEcbEncryptInit

---

**Format**

```
#include "r_tsip_rx_if.h"
e_tsip_err_t R_TSIP_TdesEcbEncryptInit(
 tsip_tdes_handle_t *handle,
 tsip_tdes_key_index_t *key_index
)
```

**Parameters**

|           |        |                          |
|-----------|--------|--------------------------|
| handle    | Output | TDES handler (work area) |
| key_index | Input  | Wrapped key              |

**Return Values**

|                             |                                                                                                                                       |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| TSIP_SUCCESS:               | Normal termination                                                                                                                    |
| TSIP_ERR_RESOURCE_CONFLICT: | Occurrence of resource conflict because a hardware resource needed by the processing routine was in use by another processing routine |
| TSIP_ERR_KEY_SET:           | Invalid wrapped key                                                                                                                   |

**Description**

The R\_TSIP\_TdesEcbEncryptInit() function performs preparations for the execution of DES calculation and writes the result to the first parameter, handle. The parameter handle is used subsequently as a parameter by the R\_TSIP\_TdesEcbEncryptUpdate() and R\_TSIP\_TdesEcbEncryptFinal() functions.

Refer to 3.7.1, Key Injection and Updating, for an explanation of how to generate key\_index.

**Reentrancy**

Not supported.

#### 4.2.4.5 R\_TSIP\_TdesEcbEncryptUpdate

---

**Format**

```
#include "r_tsip_rx_if.h"
e_tsip_err_t R_TSIP_TdesEcbEncryptUpdate(
 tsip_tdes_handle_t *handle,
 uint8_t *plain,
 uint8_t *cipher,
 uint32_t plain_length
)
```

**Parameters**

|              |              |                                                          |
|--------------|--------------|----------------------------------------------------------|
| handle       | Input/output | TDES handler (work area)                                 |
| plain        | Input        | Plaintext data area                                      |
| cipher       | Output       | Ciphertext data area                                     |
| plain_length | Input        | Byte length of plaintext data (Must be a multiple of 8.) |

**Return Values**

|                             |                         |
|-----------------------------|-------------------------|
| TSIP_SUCCESS:               | Normal termination      |
| TSIP_ERR_PARAMETER:         | Invalid handle input    |
| TSIP_ERR_PROHIBIT_FUNCTION: | Invalid function called |

**Description**

Using the handle specified by the first parameter, handle, the R\_TSIP\_TdesEcbEncryptUpdate() function encrypts the second parameter, plain, using the key index specified by the R\_TSIP\_TdesEcbEncryptInit() function, and writes the encrypted result to the third parameter, cipher. After plaintext input completes, call R\_TSIP\_TdesEcbEncryptFinal().

Except in cases where the addresses are the same, specify areas for plain and cipher that do not overlap.

**Reentrancy**

Not supported.

---

#### 4.2.4.6 R\_TSIP\_TdesEcbEncryptFinal

---

##### Format

```
#include "r_tsip_rx_if.h"
e_tsip_err_t R_TSIP_TdesEcbEncryptFinal(
 tsip_tdes_handle_t *handle,
 uint8_t *cipher,
 uint32_t *cipher_length
)
```

##### Parameters

|               |        |                                                       |
|---------------|--------|-------------------------------------------------------|
| handle        | Input  | TDES handler (work area)                              |
| cipher        | Output | Ciphertext data area (Nothing is ever written here.)  |
| cipher_length | Output | Ciphertext data length (The write value is always 0.) |

##### Return Values

|                             |                              |
|-----------------------------|------------------------------|
| TSIP_SUCCESS:               | Normal termination           |
| TSIP_ERR_FAIL:              | Occurrence of internal error |
| TSIP_ERR_PARAMETER:         | Invalid handle input         |
| TSIP_ERR_PROHIBIT_FUNCTION: | Invalid function called      |

##### Description

Using the handle specified by the first parameter, handle, the R\_TSIP\_TdesEcbEncryptFinal() function writes the calculation result to the second parameter, cipher, and writes the length of the calculation result to the third parameter, cipher\_length. The original intent was for any portion of the encrypted result that was not a multiple of 8 bytes to be written to the second parameter. However, due to the restriction that only multiples of 8 can be input to the R\_TSIP\_TdesEcbEncryptUpdate() function, nothing is ever written to cipher, and 0 is always written to cipher\_length. The parameters cipher and cipher\_length are provided for future compatibility in anticipation of this restriction eventually being removed.

##### Reentrancy

Not supported.

#### 4.2.4.7 R\_TSIP\_TdesEcbDecryptInit

---

**Format**

```
#include "r_tsip_rx_if.h"
e_tsip_err_t R_TSIP_TdesEcbDecryptInit(
 tsip_tdes_handle_t *handle,
 tsip_tdes_key_index_t *key_index
)
```

**Parameters**

|           |        |                          |
|-----------|--------|--------------------------|
| handle    | Output | TDES handler (work area) |
| key_index | Input  | Wrapped key              |

**Return Values**

|                             |                                                                                                                                       |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| TSIP_SUCCESS:               | Normal termination                                                                                                                    |
| TSIP_ERR_KEY_SET:           | Invalid wrapped key                                                                                                                   |
| TSIP_ERR_RESOURCE_CONFLICT: | Occurrence of resource conflict because a hardware resource needed by the processing routine was in use by another processing routine |

**Description**

The R\_TSIP\_TdesEcbDecryptInit() function performs preparations for the execution of DES calculation and writes the result to the first parameter, handle. The parameter handle is used subsequently as a parameter by the R\_TSIP\_TdesEcbDecryptUpdate() and R\_TSIP\_TdesEcbDecryptFinal() functions.

Refer to 3.7.1, Key Injection and Updating, for an explanation of how to generate key\_index.

**Reentrancy**

Not supported.

---

#### 4.2.4.8 R\_TSIP\_TdesEcbDecryptUpdate

---

##### Format

```
#include "r_tsip_rx_if.h"
e_tsip_err_t R_TSIP_TdesEcbDecryptUpdate(
 tsip_tdes_handle_t *handle,
 uint8_t *cipher,
 uint8_t *plain,
 uint32_t cipher_length
)
```

##### Parameters

|               |              |                                                           |
|---------------|--------------|-----------------------------------------------------------|
| handle        | Input/output | TDES handler (work area)                                  |
| cipher        | Input        | Ciphertext data area                                      |
| plain         | Output       | Plaintext data area                                       |
| cipher_length | Input        | Byte length of ciphertext data (Must be a multiple of 8.) |

##### Return Values

|                             |                         |
|-----------------------------|-------------------------|
| TSIP_SUCCESS:               | Normal termination      |
| TSIP_ERR_PARAMETER:         | Invalid handle input    |
| TSIP_ERR_PROHIBIT_FUNCTION: | Invalid function called |

##### Description

Using the handle specified by the first parameter, handle, the R\_TSIP\_TdesEcbDecryptUpdate() function decrypts the second parameter, cipher, using the key index specified by the R\_TSIP\_TdesEcbDecryptInit() function, and writes the decrypted result to the third parameter, plain. After ciphertext input completes, call R\_TSIP\_TdesEcbDecryptFinal().

Except in cases where the addresses are the same, specify areas for plain and cipher that do not overlap.

##### Reentrancy

Not supported.

---

#### 4.2.4.9 R\_TSIP\_TdesEcbDecryptFinal

---

##### Format

```
#include "r_tsip_rx_if.h"
e_tsip_err_t R_TSIP_TdesEcbDecryptFinal(
 tsip_tdes_handle_t *handle,
 uint8_t *plain,
 uint32_t *plain_length
)
```

##### Parameters

|              |        |                                                      |
|--------------|--------|------------------------------------------------------|
| handle       | Input  | TDES handler (work area)                             |
| plain        | Output | Plaintext data area (Nothing is ever written here.)  |
| plain_length | Output | Plaintext data length (The write value is always 0.) |

##### Return Values

|                             |                              |
|-----------------------------|------------------------------|
| TSIP_SUCCESS:               | Normal termination           |
| TSIP_ERR_FAIL:              | Occurrence of internal error |
| TSIP_ERR_PARAMETER:         | Invalid handle input         |
| TSIP_ERR_PROHIBIT_FUNCTION: | Invalid function called      |

##### Description

Using the handle specified by the first parameter, handle, the R\_TSIP\_TdesEcbDecryptFinal() function writes the calculation result to the second parameter, plain, and writes the length of the calculation result to the third parameter, plain\_length. The original intent was for any portion of the decrypted result that was not a multiple of 8 bytes to be written to the second parameter. However, due to the restriction that only multiples of 8 can be input to the R\_TSIP\_TdesEcbDecryptUpdate() function, nothing is ever written to plain, and 0 is always written to plain\_length. The parameters plain and plain\_length are provided for future compatibility in anticipation of this restriction eventually being removed.

##### Reentrancy

Not supported.

---

#### 4.2.4.10 R\_TSIP\_TdesCbcEncryptInit

---

##### Format

```
#include "r_tsip_rx_if.h"
e_tsip_err_t R_TSIP_TdesCbcEncryptInit(
 tsip_tdes_handle_t *handle,
 tsip_tdes_key_index_t *key_index,
 uint8_t *ivec
)
```

##### Parameters

|           |        |                                 |
|-----------|--------|---------------------------------|
| handle    | Output | TDES handler (work area)        |
| key_index | Input  | Wrapped key                     |
| ivec      | Input  | Initialization vector (8 bytes) |

##### Return Values

|                             |                                                                                                                                       |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| TSIP_SUCCESS:               | Normal termination                                                                                                                    |
| TSIP_ERR_KEY_SET:           | Invalid wrapped key input                                                                                                             |
| TSIP_ERR_RESOURCE_CONFLICT: | Occurrence of resource conflict because a hardware resource needed by the processing routine was in use by another processing routine |

##### Description

The R\_TSIP\_TdesCbcEncryptInit() function performs preparations for the execution of DES calculation, and writes the result to the first parameter, handle. The parameter handle is used subsequently as a parameter by the R\_TSIP\_TdesCbcEncryptUpdate() and R\_TSIP\_TdesCbcEncryptFinal() functions.

Refer to 3.7.1, Key Injection and Updating, for an explanation of how to generate key\_index.

##### Reentrancy

Not supported.

---

#### 4.2.4.11 R\_TSIP\_TdesCbcEncryptUpdate

---

##### Format

```
#include "r_tsip_rx_if.h"
e_tsip_err_t R_TSIP_TdesCbcEncryptUpdate(
 tsip_tdes_handle_t *handle,
 uint8_t *plain,
 uint8_t *cipher,
 uint32_t plain_length
)
```

##### Parameters

|              |              |                                                          |
|--------------|--------------|----------------------------------------------------------|
| handle       | Input/output | TDES handler (work area)                                 |
| plain        | Input        | Plaintext data area                                      |
| cipher       | Output       | Ciphertext data area                                     |
| plain_length | Input        | Byte length of plaintext data (Must be a multiple of 8.) |

##### Return Values

|                             |                         |
|-----------------------------|-------------------------|
| TSIP_SUCCESS:               | Normal termination      |
| TSIP_ERR_PARAMETER:         | Invalid handle input    |
| TSIP_ERR_PROHIBIT_FUNCTION: | Invalid function called |

##### Description

Using the handle specified by the first parameter, handle, the R\_TSIP\_TdesCbcEncryptUpdate() function encrypts the second parameter, plain, using the key index specified by the R\_TSIP\_TdesCbcEncryptInit() function, and writes the encrypted result to the third parameter, cipher. After plaintext input completes, call R\_TSIP\_TdesCbcEncryptFinal().

Except in cases where the addresses are the same, specify areas for plain and cipher that do not overlap.

##### Reentrancy

Not supported.

---

#### 4.2.4.12 R\_TSIP\_TdesCbcEncryptFinal

---

##### Format

```
#include "r_tsip_rx_if.h"
e_tsip_err_t R_TSIP_TdesCbcEncryptFinal(
 tsip_tdes_handle_t *handle,
 uint8_t *cipher,
 uint32_t *cipher_length
)
```

##### Parameters

|               |        |                                                       |
|---------------|--------|-------------------------------------------------------|
| handle        | Input  | TDES handler (work area)                              |
| cipher        | Output | Ciphertext data area (Nothing is ever written here.)  |
| cipher_length | Output | Ciphertext data length (The write value is always 0.) |

##### Return Values

|                             |                              |
|-----------------------------|------------------------------|
| TSIP_SUCCESS:               | Normal termination           |
| TSIP_ERR_FAIL:              | Occurrence of internal error |
| TSIP_ERR_PARAMETER:         | Invalid handle input         |
| TSIP_ERR_PROHIBIT_FUNCTION: | Invalid function called      |

##### Description

Using the handle specified by the first parameter, handle, the R\_TSIP\_TdesCbcEncryptFinal() function writes the calculation result to the second parameter, cipher, and writes the length of the calculation result to the third parameter, cipher\_length. The original intent was for any portion of the encrypted result that was not a multiple of 8 bytes to be written to the second parameter. However, due to the restriction that only multiples of 8 can be input to the R\_TSIP\_TdesCbcEncryptUpdate() function, nothing is ever written to cipher, and 0 is always written to cipher\_length. The parameters cipher and cipher\_length are provided for future compatibility in anticipation of this restriction eventually being removed.

##### Reentrancy

Not supported.

#### 4.2.4.14 R\_TSIP\_TdesCbcDecryptUpdate

---

##### Format

```
#include "r_tsip_rx_if.h"
e_tsip_err_t R_TSIP_TdesCbcDecryptUpdate(
 tsip_tdes_handle_t *handle,
 uint8_t *cipher,
 uint8_t *plain,
 uint32_t cipher_length
)
```

##### Parameters

|               |              |                                                           |
|---------------|--------------|-----------------------------------------------------------|
| handle        | Input/output | TDES handler (work area)                                  |
| cipher        | Input        | Ciphertext data area                                      |
| plain         | Output       | Plaintext data area                                       |
| cipher_length | Input        | Byte length of ciphertext data (Must be a multiple of 8.) |

##### Return Values

|                             |                         |
|-----------------------------|-------------------------|
| TSIP_SUCCESS:               | Normal termination      |
| TSIP_ERR_PARAMETER:         | Invalid handle input    |
| TSIP_ERR_PROHIBIT_FUNCTION: | Invalid function called |

##### Description

Using the handle specified by the first parameter, handle, the R\_TSIP\_TdesCbcDecryptUpdate() function decrypts the second parameter, cipher, utilizing the key index specified by the R\_TSIP\_TdesCbcDecryptInit() function, and writes the decrypted result to the third parameter, plain. After ciphertext input completes, call R\_TSIP\_TdesCbcDecryptFinal().

Except in cases where the addresses are the same, specify areas for plain and cipher that do not overlap.

##### Reentrancy

Not supported.

---

#### 4.2.4.15 R\_TSIP\_TdesCbcDecryptFinal

---

##### Format

```
#include "r_tsip_rx_if.h"
e_tsip_err_t R_TSIP_TdesCbcDecryptFinal(
 tsip_tdes_handle_t *handle,
 uint8_t *plain,
 uint32_t *plain_length
)
```

##### Parameters

|              |        |                                                      |
|--------------|--------|------------------------------------------------------|
| handle       | Input  | TDES handler (work area)                             |
| plain        | Output | Plaintext data area (Nothing is ever written here.)  |
| plain_length | Output | Plaintext data length (The write value is always 0.) |

##### Return Values

|                             |                              |
|-----------------------------|------------------------------|
| TSIP_SUCCESS:               | Normal termination           |
| TSIP_ERR_FAIL:              | Occurrence of internal error |
| TSIP_ERR_PARAMETER:         | Invalid handle input         |
| TSIP_ERR_PROHIBIT_FUNCTION: | Invalid function called      |

##### Description

Using the handle specified by the first parameter, handle, the R\_TSIP\_TdesCbcDecryptFinal() function writes the calculation result to the second parameter, plain, and writes the length of the calculation result to the third parameter, plain\_length. The original intent was for any portion of the decrypted result that was not a multiple of 8 bytes to be written to the second parameter. However, due to the restriction that only multiples of 8 can be input to the R\_TSIP\_TdesCbcDecryptUpdate() function, nothing is ever written to plain, and 0 is always written to plain\_length. The parameters plain and plain\_length are provided for future compatibility in anticipation of this restriction eventually being removed.

##### Reentrancy

Not supported.

## 4.2.5 ARC4

### 4.2.5.1 R\_TSIP\_GenerateArc4KeyIndex

#### Format

```
#include "r_tsip_rx_if.h"
e_tsip_err_t R_TSIP_GenerateArc4KeyIndex(
 uint8_t *encrypted_provisioning_key,
 uint8_t *iv,
 uint8_t *encrypted_key,
 tsip_arc4_key_index_t *key_index
)
```

#### Parameters

|                            |        |                                                     |
|----------------------------|--------|-----------------------------------------------------|
| encrypted_provisioning_key | Input  | W-UFPK                                              |
| iv                         | Input  | Initialization vector when generating encrypted_key |
| encrypted_key              | Input  | Encrypted key encrypted using UFPK                  |
| key_index                  | Output | Key index                                           |

#### Return Values

|                             |                                                                                                                                       |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| TSIP_SUCCESS:               | Normal termination                                                                                                                    |
| TSIP_ERR_FAIL:              | Occurrence of internal error                                                                                                          |
| TSIP_ERR_RESOURCE_CONFLICT: | Occurrence of resource conflict because a hardware resource needed by the processing routine was in use by another processing routine |

#### Description

This API outputs an ARC4 wrapped key.

Refer to 7.3.3, ARC4, for the format of the data encrypted using the UFPK input as encrypted\_key.

Refer to 3.7.1, Key Injection and Updating, for an explanation of encrypted\_key, iv, and encrypted\_provisioning\_key and how to use key\_index.

#### Reentrancy

Not supported.

---

#### 4.2.5.2 R\_TSIP\_UpdateArc4KeyIndex

---

##### Format

```
#include "r_tsip_rx_if.h"
e_tsip_err_t R_TSIP_UpdateArc4KeyIndex(
 uint8_t *iv,
 uint8_t *encrypted_key,
 tsip_arc4_key_index_t *key_index
)
```

##### Parameters

|               |        |                                                     |
|---------------|--------|-----------------------------------------------------|
| iv            | Input  | Initialization vector when generating encrypted_key |
| encrypted_key | Input  | Encrypted key encrypted using KUK                   |
| key_index     | Output | Key index                                           |

##### Return Values

|                             |                                                                                                                                       |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| TSIP_SUCCESS:               | Normal termination                                                                                                                    |
| TSIP_ERR_FAIL:              | Occurrence of internal error                                                                                                          |
| TSIP_ERR_RESOURCE_CONFLICT: | Occurrence of resource conflict because a hardware resource needed by the processing routine was in use by another processing routine |

##### Description

This API updates an ARC4 wrapped key.

Refer to 7.3.3, ARC4, for the format of the data encrypted using the KUK input as encrypted\_key.

Refer to 3.7.1, Key Injection and Updating, for an explanation of iv and encrypted\_key and how to use key\_index.

##### Reentrancy

Not supported.

### 4.2.5.3 R\_TSIP\_GenerateArc4RandomKeyIndex

---

**Format**

```
#include "r_tsip_rx_if.h"
e_tsip_err_t R_TSIP_GenerateArc4RandomKeyIndex(
 tsip_arc4_key_index_t *key_index
)
```

**Parameters**

|           |        |             |
|-----------|--------|-------------|
| key_index | Output | Wrapped key |
|-----------|--------|-------------|

**Return Values**

|                             |                                                                                                                                       |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| TSIP_SUCCESS:               | Normal termination                                                                                                                    |
| TSIP_ERR_RESOURCE_CONFLICT: | Occurrence of resource conflict because a hardware resource needed by the processing routine was in use by another processing routine |

**Description**

This API outputs an ARC4 wrapped key.

This API generates a user key from a random number within the TSIP. Therefore, no user key needs to be input. Encrypting data using the wrapped key output by this API makes it possible to prevent dead copying of data.

Refer to 3.7.1, Key Injection and Updating, for an explanation of how to use key\_index.

**Reentrancy**

Not supported.

---

#### 4.2.5.4 R\_TSIP\_Arc4EncryptInit

---

**Format**

```
#include "r_tsip_rx_if.h"
e_tsip_err_t R_TSIP_Arc4EncryptInit(
 tsip_arc4_handle_t *handle,
 tsip_arc4_key_index_t *key_index
)
```

**Parameters**

|           |        |                          |
|-----------|--------|--------------------------|
| handle    | Output | ARC4 handler (work area) |
| key_index | Input  | Wrapped key              |

**Return Values**

|                             |                                                                                                                                       |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| TSIP_SUCCESS:               | Normal termination                                                                                                                    |
| TSIP_ERR_FAIL:              | Occurrence of internal error                                                                                                          |
| TSIP_ERR_RESOURCE_CONFLICT: | Occurrence of resource conflict because a hardware resource needed by the processing routine was in use by another processing routine |
| TSIP_ERR_KEY_SET:           | Invalid wrapped key input                                                                                                             |

**Description**

The R\_TSIP\_Arc4EncryptInit() function performs preparations for the execution of ARC4 calculation, and writes the result to the first parameter, handle. The parameter handle is used subsequently as a parameter by the R\_TSIP\_Arc4EncryptUpdate() and R\_TSIP\_Arc4EncryptFinal() functions.

Refer to 3.7.1, Key Injection and Updating, for an explanation of how to generate key\_index.

**Reentrancy**

Not supported.

---

#### 4.2.5.5 R\_TSIP\_Arc4EncryptUpdate

---

##### Format

```
#include "r_tsip_rx_if.h"
e_tsip_err_t R_TSIP_Arc4EncryptUpdate(
 tsip_arc4_handle_t *handle,
 uint8_t *plain,
 uint8_t *cipher,
 uint32_t plain_length
)
```

##### Parameters

|              |              |                                                           |
|--------------|--------------|-----------------------------------------------------------|
| handle       | Input/output | ARC4 handler (work area)                                  |
| plain        | Input        | Plaintext data area                                       |
| cipher       | Output       | Ciphertext data area                                      |
| plain_length | Input        | Byte length of plaintext data (Must be a multiple of 16.) |

##### Return Values

|                             |                         |
|-----------------------------|-------------------------|
| TSIP_SUCCESS:               | Normal termination      |
| TSIP_ERR_PARAMETER:         | Invalid handle input    |
| TSIP_ERR_PROHIBIT_FUNCTION: | Invalid function called |

##### Description

The R\_TSIP\_Arc4EncryptUpdate() function encrypts the second parameter, plain, using the key index specified by the R\_TSIP\_Arc4EncryptInit() function, and writes the encrypted result to the third parameter, cipher. After plaintext input completes, call R\_TSIP\_Arc4EncryptFinal().

Except in cases where the addresses are the same, specify areas for plain and cipher that do not overlap.

##### Reentrancy

Not supported.

---

#### 4.2.5.6 R\_TSIP\_Arc4EncryptFinal

---

##### Format

```
#include "r_tsip_rx_if.h"
e_tsip_err_t R_TSIP_Arc4EncryptFinal(
 tsip_arc4_handle_t *handle,
 uint8_t *cipher,
 uint32_t *cipher_length
)
```

##### Parameters

|               |        |                                                       |
|---------------|--------|-------------------------------------------------------|
| handle        | Input  | ARC4 handler (work area)                              |
| cipher        | Output | Ciphertext data area (Nothing is ever written here.)  |
| cipher_length | Output | Ciphertext data length (The write value is always 0.) |

##### Return Values

|                             |                              |
|-----------------------------|------------------------------|
| TSIP_SUCCESS:               | Normal termination           |
| TSIP_ERR_FAIL:              | Occurrence of internal error |
| TSIP_ERR_PARAMETER:         | Invalid handle input         |
| TSIP_ERR_PROHIBIT_FUNCTION: | Invalid function called      |

##### Description

Using the handle specified by the first parameter, handle, the R\_TSIP\_Arc4EncryptFinal() function writes the calculation result to the second parameter, cipher, and writes the length of the calculation result to the third parameter, cipher\_length. The original intent was for any portion of the encrypted result that was not a multiple of 16 bytes to be written to the second parameter. However, due to the restriction that only multiples of 16 can be input to the R\_TSIP\_Arc4EncryptUpdate() function, nothing is ever written to cipher, and 0 is always written to cipher\_length. The parameters cipher and cipher\_length are provided for future compatibility in anticipation of this restriction eventually being removed.

##### Reentrancy

Not supported.

### 4.2.5.7 R\_TSIP\_Arc4DecryptInit

---

**Format**

```
#include "r_tsip_rx_if.h"
e_tsip_err_t R_TSIP_Arc4DecryptInit(
 tsip_arc4_handle_t *handle,
 tsip_arc4_key_index_t *key_index
)
```

**Parameters**

|           |        |                          |
|-----------|--------|--------------------------|
| handle    | Output | ARC4 handler (work area) |
| key_index | Input  | Wrapped key              |

**Return Values**

|                             |                                                                                                                                       |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| TSIP_SUCCESS:               | Normal termination                                                                                                                    |
| TSIP_ERR_RESOURCE_CONFLICT: | Occurrence of resource conflict because a hardware resource needed by the processing routine was in use by another processing routine |
| TSIP_ERR_KEY_SET:           | Invalid wrapped key                                                                                                                   |

**Description**

The R\_TSIP\_Arc4DecryptInit() function performs preparations for the execution of ARC4 calculation, and writes the result to the first parameter, handle. The parameter handle is used subsequently as a parameter by the R\_TSIP\_Arc4DecryptUpdate() and R\_TSIP\_Arc4DecryptFinal() functions.

Refer to 3.7.1, Key Injection and Updating, for an explanation of how to generate key\_index.

**Reentrancy**

Not supported.

---

#### 4.2.5.8 R\_TSIP\_Arc4DecryptUpdate

---

##### Format

```
#include "r_tsip_rx_if.h"
e_tsip_err_t R_TSIP_Arc4DecryptUpdate(
 tsip_arc4_handle_t *handle,
 uint8_t *cipher,
 uint8_t *plain,
 uint32_t cipher_length
)
```

##### Parameters

|               |              |                                                            |
|---------------|--------------|------------------------------------------------------------|
| handle        | Input/output | ARC4 handler (work area)                                   |
| cipher        | Input        | Ciphertext data area                                       |
| plain         | Output       | Plaintext data area                                        |
| cipher_length | Input        | Byte length of ciphertext data (Must be a multiple of 16.) |

##### Return Values

|                             |                         |
|-----------------------------|-------------------------|
| TSIP_SUCCESS:               | Normal termination      |
| TSIP_ERR_PARAMETER:         | Invalid handle input    |
| TSIP_ERR_PROHIBIT_FUNCTION: | Invalid function called |

##### Description

Using the handle specified by the first parameter, handle, the R\_TSIP\_Arc4DecryptUpdate() function decrypts the second parameter, cipher, utilizing the key index specified by the R\_TSIP\_Arc4DecryptInit() function, and writes the decrypted result to the third parameter, plain. After ciphertext input completes, call R\_TSIP\_Arc4DecryptFinal().

Except in cases where the addresses are the same, specify areas for plain and cipher that do not overlap.

##### Reentrancy

Not supported.

---

#### 4.2.5.9 R\_TSIP\_Arc4DecryptFinal

---

##### Format

```
#include "r_tsip_rx_if.h"
e_tsip_err_t R_TSIP_Aes128EcbDecryptFinal(
 tsip_aes_handle_t *handle,
 uint8_t *plain,
 uint32_t *plain_length
)
```

##### Parameters

|              |        |                                                      |
|--------------|--------|------------------------------------------------------|
| handle       | Input  | ARC4 handler (work area)                             |
| plain        | Output | Plaintext data area (Nothing is ever written here.)  |
| plain_length | Output | Plaintext data length (The write value is always 0.) |

##### Return Values

|                             |                              |
|-----------------------------|------------------------------|
| TSIP_SUCCESS:               | Normal termination           |
| TSIP_ERR_FAIL:              | Occurrence of internal error |
| TSIP_ERR_PARAMETER:         | Invalid handle input         |
| TSIP_ERR_PROHIBIT_FUNCTION: | Invalid function called      |

##### Description

Using the handle specified by the first parameter, handle, the R\_TSIP\_Arc4DecryptFinal() function writes the calculation result to the second parameter, plain, and writes the length of the calculation result to the third parameter, plain\_length. The original intent was for any portion of the decrypted result that was not a multiple of 16 bytes to be written to the second parameter. However, due to the restriction that only multiples of 16 can be input to the R\_TSIP\_Arc4DecryptUpdate() function, nothing is ever written to plain, and 0 is always written to plain\_length. The parameters plain and plain\_length are provided for future compatibility in anticipation of this restriction eventually being removed.

##### Reentrancy

Not supported.

## 4.2.6 RSA

### 4.2.6.1 R\_TSIP\_GenerateRsaXXXPublicKeyIndex

#### Format

```

(1) #include "r_tsip_rx_if.h"
 e_tsip_err_t R_TSIP_GenerateRsa1024PublicKeyIndex(
 uint8_t *encrypted_provisioning_key,
 uint8_t *iv,
 uint8_t *encrypted_key,
 tsip_rsa1024_public_key_index_t *key_index
)
(2) #include "r_tsip_rx_if.h"
 e_tsip_err_t R_TSIP_GenerateRsa2048PublicKeyIndex(
 uint8_t *encrypted_provisioning_key,
 uint8_t *iv,
 uint8_t *encrypted_key,

| key_management_info2 | Key management information                                                                             |

### Return Values

|                             |                                                                                                                                       |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| TSIP_SUCCESS:               | Normal termination                                                                                                                    |
| TSIP_ERR_RESOURCE_CONFLICT: | Occurrence of resource conflict because a hardware resource needed by the processing routine was in use by another processing routine |
| TSIP_ERR_FAIL               | Occurrence of internal error                                                                                                          |

### Description

This API outputs a 1024-bit, 2048-bit, 3072-bit, or 4096-bit RSA public wrapped key.

Refer to 7.3.4, RSA, for the format of the data encrypted using the UFPK input as encrypted\_key.

Ensure that the areas allocated for encrypted\_key and key\_index do not overlap.

Refer to 3.7.1, Key Injection and Updating, for an explanation of encrypted\_provisioning\_key, iv, and encrypted\_key and how to use key\_index.

### Reentrancy

Not supported.

**4.2.6.2 R\_TSIP\_GenerateRsaXXXPrivateKeyIndex****Format**

```

(1) #include "r_tsip_rx_if.h"
 e_tsip_err_t R_TSIP_GenerateRsa1024PrivateKeyIndex(
 uint8_t *encrypted_provisioning_key,
 uint8_t *iv,
 uint8_t *encrypted_key,
 tsip_rsa1024_private_key_index_t *key_index
)

(2) #include "r_tsip_rx_if.h"
 e_tsip_err_t R_TSIP_GenerateRsa2048PrivateKeyIndex(
 uint8_t *encrypted_provisioning_key,
 uint8_t *iv,
 uint8_t *encrypted_key,
 tsip_rsa2048_private_key_index_t *key_index
)

```

**Parameters**

|                            |        |                                                     |
|----------------------------|--------|-----------------------------------------------------|
| encrypted_provisioning_key | Input  | W-UFPK                                              |
| iv                         | Input  | Initialization vector when generating encrypted_key |
| encrypted_key              | Input  | Encrypted key encrypted using UFPK                  |
| key_index                  | Output | Wrapped key<br>(1) 1024-bit RSA<br>(2) 2048-bit RSA |

**Return Values**

|                             |                                                                                                                                       |

**Description**

This API outputs a 1024-bit or 2048-bit RSA secret wrapped key.

Refer to 7.3.4, RSA, for the format of the data encrypted using the UFPK input as encrypted\_key.

Ensure that the areas allocated for encrypted\_key and key\_index do not overlap.

Refer to 3.7.1, Key Injection and Updating, for an explanation of encrypted\_provisioning\_key, iv, and encrypted\_key and how to use key\_index.

**Reentrancy**

Not supported.

**4.2.6.3 R\_TSIP\_UpdateRsaXXXPublicKeyIndex****Format**

- ```
(1) #include "r_tsip_rx_if.h"
    e_tsip_err_t R_TSIP_UpdateRsa1024PublicKeyIndex(
        uint8_t *iv,
        uint8_t *encrypted_key,
        tsip_rsa1024_public_key_index_t *key_index
    )

(2) #include "r_tsip_rx_if.h"
    e_tsip_err_t R_TSIP_UpdateRsa2048PublicKeyIndex(
        uint8_t *iv,
        uint8_t *encrypted_key,
        tsip_rsa2048_public_key_index_t *key_index
    )

(3) #include "r_tsip_rx_if.h"
    e_tsip_err_t R_TSIP_UpdateRsa3072PublicKeyIndex(
        uint8_t *iv,
        uint8_t *encrypted_key,
        tsip_rsa3072_public_key_index_t *key_index
    )

(4) #include "r_tsip_rx_if.h"
    e_tsip_err_t R_TSIP_UpdateRsa4096PublicKeyIndex(
        uint8_t *iv,
        uint8_t *encrypted_key,
        tsip_rsa4096_public_key_index_t *key_index
    )
```

Parameters

iv	Input	Initialization vector when generating encrypted_key
encrypted_key	Input	Encrypted key encrypted using KUK
key_index	Output	Wrapped key
value		Public key value
key_management_info1		Key management information
key_n		Modulus n (plaintext)
		(1) 1024-bit RSA
		(2) 2048-bit RSA
		(3) 3072-bit RSA
		(4) 4096-bit RSA
key_e		Exponent e (plaintext)
		(1) 1024-bit RSA
		(2) 2048-bit RSA
		(3) 3072-bit RSA
		(4) 4096-bit RSA
dummy		Dummy
key_management_info2		Key management information

Return Values

TSIP_SUCCESS:	Normal termination
TSIP_ERR_RESOURCE_CONFLICT:	Occurrence of resource conflict because a hardware resource needed by the processing routine was in use by another processing routine
TSIP_ERR_FAIL	Occurrence of internal error

Description

This API updates a 1024-bit, 2048-bit, 3072-bit, or 4096-bit RSA public wrapped key.

Refer to 7.3.4, RSA, for the format of the data encrypted using the KUK input as encrypted_key.

Refer to 3.7.1, Key Injection and Updating, for an explanation of iv and encrypted_key and how to use key_index.

Reentrancy

Not supported.

4.2.6.4 R_TSIP_UpdateRsaXXXPrivateKeyIndex**Format**

```

(1) #include "r_tsip_rx_if.h"
    e_tsip_err_t R_TSIP_UpdateRsa1024PrivateKeyIndex(
        uint8_t *iv,
        uint8_t *encrypted_key,
        tsip_rsa1024_private_key_index_t *key_index
    )
(2) #include "r_tsip_rx_if.h"
    e_tsip_err_t R_TSIP_UpdateRsa2048PrivateKeyIndex(
        uint8_t *iv,
        uint8_t *encrypted_key,
        tsip_rsa2048_private_key_index_t *key_index
    )

```

Parameters

iv	Input	Initialization vector when generating encrypted_key
encrypted_key	Input	Encrypted key encrypted using KUK
key_index	Output	Wrapped key (1) 1024-bit RSA (2) 2048-bit RSA

Return Values

TSIP_SUCCESS:	Normal termination
TSIP_ERR_RESOURCE_CONFLICT:	Occurrence of resource conflict because a hardware resource needed by the processing routine was in use by another processing routine
TSIP_ERR_FAIL	Occurrence of internal error

Description

This API updates a 1024-bit or 2048-bit RSA secret wrapped key. Refer to 7.3.4, RSA, for the format of the data encrypted using the UFPK input as encrypted_key.

Refer to 3.7.1, Key Injection and Updating, for an explanation of iv and encrypted_key and how to use key_index.

Reentrancy

Not supported.

4.2.6.5 R_TSIP_GenerateRsaXXXRandomKeyIndex**Format**

```
(1) #include "r_tsip_rx_if.h"
    e_tsip_err_t R_TSIP_GenerateRsa1024RandomKeyIndex(
        tsip_rsa1024_key_pair_index_t *key_pair_index
    )
(2) #include "r_tsip_rx_if.h"
    e_tsip_err_t R_TSIP_GenerateRsa2048RandomKeyIndex(
        tsip_rsa2048_key_pair_index_t *key_pair_index
    )
```

Parameters

key_pair_index	Output	RSA key pair wrapped keys
public		RSA public wrapped key
value		Public key value
key_management_info1		Key management information
key_n		Modulus n (plaintext) (1) 1024-bit RSA (2) 2048-bit RSA
key_e		Exponent e (plaintext) (1) 1024-bit RSA (2) 2048-bit RSA
dummy		Dummy
key_management_info2		Key management information
private		RSA secret wrapped key

Return Values

TSIP_SUCCESS:	Normal termination
TSIP_ERR_RESOURCE_CONFLICT:	Occurrence of resource conflict because a hardware resource needed by the processing routine was in use by another processing routine
TSIP_ERR_FAIL	Occurrence of internal error

Description

This API outputs 1024-bit or 2048-bit wrapped keys for an RSA public key–secret key pair. The API generates a user key from a random number within the TSIP. Therefore, no user key needs to be input. Encrypting data using the wrapped keys output by this API makes it possible to prevent dead copying of data. The public wrapped key is generated in `key_pair_index->public`, and the secret wrapped key is generated in `key_pair_index->private`. The only public key exponent generated is 0x00010001.

Refer to 3.7.1, Key Injection and Updating, for an explanation of how to use `key_pair_index->public` and `key_pair_index->private`. The parameter `key_pair_index->public` is utilized in the same manner as the public wrapped key output by `R_TSIP_GenerateRsaXXXPublicKeyIndex()`, and `key_pair_index->private` is utilized in the same manner as the secret wrapped key output by `R_TSIP_GenerateRsaXXXPrivateKeyIndex()`.

Reentrancy

Not supported.

4.2.6.6 R_TSIP_RsaesPkcsXXXEncrypt**Format**

```

(1) #include "r_tsip_rx_if.h"
    e_tsip_err_t R_TSIP_RsaesPkcs1024Encrypt(
        tsip_rsa_byte_data_t *plain,
        tsip_rsa_byte_data_t *cipher,
        tsip_rsa1024_public_key_index_t *key_index
    )

(2) #include "r_tsip_rx_if.h"
    e_tsip_err_t R_TSIP_RsaesPkcs2048Encrypt(
        tsip_rsa_byte_data_t *plain,
        tsip_rsa_byte_data_t *cipher,
        tsip_rsa2048_public_key_index_t *key_index
    )

(3) #include "r_tsip_rx_if.h"
    e_tsip_err_t R_TSIP_RsaesPkcs3072Encrypt(
        tsip_rsa_byte_data_t *plain,
        tsip_rsa_byte_data_t *cipher,
        tsip_rsa3072_public_key_index_t *key_index
    )

(4) #include "r_tsip_rx_if.h"
    e_tsip_err_t R_TSIP_RsaesPkcs4096Encrypt(
        tsip_rsa_byte_data_t *plain,
        tsip_rsa_byte_data_t *cipher,
        tsip_rsa4096_public_key_index_t *key_index
    )

```

Parameters

plain	Input	Plaintext data to be encrypted
pdata		Specifies pointer to array containing plaintext.
data_length		Specifies valid data length of plaintext array. Data size <= modulus n size – 11
cipher	Output	Encrypted data
pdata		Specifies pointer to array containing ciphertext.
data_length		Inputs ciphertext buffer size, and outputs valid data length after encryption (modulus n size)
key_index	Input	Wrapped key
		(1) 1024-bit RSA
		(2) 2048-bit RSA
		(3) 3072-bit RSA
		(4) 4096-bit RSA

Return Values

TSIP_SUCCESS:	Normal termination
TSIP_ERR_RESOURCE_CONFLICT:	Occurrence of resource conflict because a hardware resource needed by the processing routine was in use by another processing routine
TSIP_ERR_KEY_SET	Invalid wrapped key input
TSIP_ERR_PARAMETER	Invalid input data
TSIP_ERR_FAIL	Occurrence of internal error (Only for XXX = 3072, 4096)

Description

The R_TSIP_RsaesPkcsXXXEncrypt() function encrypts in RSA mode the plaintext input as the first parameter, plain, according to RSAES-PKCS1-V1_5. It then writes the encrypted result to the second parameter, cipher.

Refer to 3.7.1, Key Injection and Updating, for an explanation of how to generate key_index.

Reentrancy

Not supported.

4.2.6.7 R_TSIP_RsaesPkcsXXXDecrypt**Format**

```

(1) #include "r_tsip_rx_if.h"
    e_tsip_err_t R_TSIP_RsaesPkcs1024Decrypt(
        tsip_rsa_byte_data_t *cipher,
        tsip_rsa_byte_data_t *plain,
        tsip_rsa1024_private_key_index_t *key_index
    )
(2) #include "r_tsip_rx_if.h"
    e_tsip_err_t R_TSIP_RsaesPkcs2048Decrypt(
        tsip_rsa_byte_data_t *cipher,
        tsip_rsa_byte_data_t *plain,
        tsip_rsa2048_private_key_index_t *key_index
    )

```

Parameters

cipher	Input	Encrypted data to be decrypted
pdata		Specifies pointer to array containing ciphertext.
data_length		Specifies valid data length of ciphertext array (modulus n size).
plain	Output	Decrypted plaintext data
pdata		Specifies pointer to array containing plaintext.
data_length		Specifies valid data length of plaintext array. Data size <= modulus n size – 11
key_index	Input	Wrapped key (1) 1024-bit RSA (2) 2048-bit RSA

Return Values

TSIP_SUCCESS:	Normal termination
TSIP_ERR_RESOURCE_CONFLICT:	Occurrence of resource conflict because a hardware resource needed by the processing routine was in use by another processing routine
TSIP_ERR_KEY_SET	Invalid wrapped key input
TSIP_ERR_PARAMETER	Invalid input data

Description

The R_TSIP_RsaesPkcsXXXDecrypt() function decrypts in RSA mode the ciphertext input as the first parameter, cipher, according to RSAES-PKCS1-V1_5. It then writes the decrypted result to the second parameter, plain.

Refer to 3.7.1, Key Injection and Updating, for an explanation of how to generate key_index.

Reentrancy

Not supported.

4.2.6.8 R_TSIP_RsassaPkcsXXXSignatureGenerate**Format**

```

(1) #include "r_tsip_rx_if.h"
    e_tsip_err_t R_TSIP_RsassaPkcs1024SignatureGenerate(
        tsip_rsa_byte_data_t *message_hash,
        tsip_rsa_byte_data_t *signature,
        tsip_rsa1024_private_key_index_t *key_index,
        uint8_t hash_type
    )
(2) #include "r_tsip_rx_if.h"
    e_tsip_err_t R_TSIP_RsassaPkcs2048SignatureGenerate(
        tsip_rsa_byte_data_t *message_hash,
        tsip_rsa_byte_data_t *signature,
        tsip_rsa2048_private_key_index_t *key_index,
        uint8_t hash_type
    )

```

Parameters

message_hash	Input	Message or hash value information to which to attach signature
pdata		Specifies pointer to array containing message or hash value.
data_length		Specifies valid data length of array (specified for message only).
data_type		Selects data type of message_hash. Message: 0 Hash value: 1
signature	Output	Signature text storage destination information
pdata		Specifies pointer to array containing signature text.
data_length		Data length (byte units)
key_index	Input	Wrappd key (1) 1024-bit RSA (2) 2048-bit RSA
hash_type	Input	Hash type to attach to signature R_TSIP_RSA_HASH_MD5 R_TSIP_RSA_HASH_SHA1 R_TSIP_RSA_HASH_SHA256

Return Values

TSIP_SUCCESS:	Normal termination
TSIP_ERR_RESOURCE_CONFLICT:	Occurrence of resource conflict because a hardware resource needed by the processing routine was in use by another processing routine
TSIP_ERR_KEY_SET	Invalid wrapped key input
TSIP_ERR_PARAMETER	Invalid input data

Description

The R_TSIP_RsassaPkcsXXXSignatureGenerate() function generates, in accordance with RSASSA-PKCS1-V1_5, signature text from the message text or hash value input as the first parameter, message_hash, using the secret wrapped key input as the third parameter, key_index, and writes the result to the second parameter, signature. When a message is specified as the first parameter, message_hash->data_type, a hash value is calculated from the message as specified by the fourth parameter, hash_type. When specifying a hash value in the first parameter, message_hash->data_type, a hash value calculated with the hash algorithm specified by the fourth parameter, hash_type, must be input as message_hash->pdata.

Refer to 3.7.1, Key Injection and Updating, for an explanation of how to generate key_index.

Reentrancy

Not supported.

4.2.6.9 R_TSIP_RsassaPkcsXXXSignatureVerification**Format**

```

(1) #include "r_tsip_rx_if.h"
    e_tsip_err_t R_TSIP_RsassaPkcs1024SignatureVerification(
        tsip_rsa_byte_data_t *signature,
        tsip_rsa_byte_data_t *message_hash,
        tsip_rsa1024_public_key_index_t *key_index,
        uint8_t hash_type
    )

(2) #include "r_tsip_rx_if.h"
    e_tsip_err_t R_TSIP_RsassaPkcs2048SignatureVerification(
        tsip_rsa_byte_data_t *signature,
        tsip_rsa_byte_data_t *message_hash,
        tsip_rsa2048_public_key_index_t *key_index,
        uint8_t hash_type
    )

(3) #include "r_tsip_rx_if.h"
    e_tsip_err_t R_TSIP_RsassaPkcs3072SignatureVerification(
        tsip_rsa_byte_data_t *signature,
        tsip_rsa_byte_data_t *message_hash,
        tsip_rsa3072_public_key_index_t *key_index,
        uint8_t hash_type
    )

(4) #include "r_tsip_rx_if.h"
    e_tsip_err_t R_TSIP_RsassaPkcs4096SignatureVerification(
        tsip_rsa_byte_data_t *signature,
        tsip_rsa_byte_data_t *message_hash,
        tsip_rsa4096_public_key_index_t *key_index,
        uint8_t hash_type
    )

```

Parameters

signature	Input	Signature text information to be verified
pdata		Specifies pointer to array containing signature text.
message_hash	Input	Message text or hash value information to be verified
pdata		Specifies pointer to array containing message or hash value.
data_length		Specifies valid data length of array (specified for message only).
data_type		Selects data type of message_hash. Message: 0 Hash value: 1
key_index	Input	Wrapped key (1) 1024-bit RSA (2) 2048-bit RSA (3) 3072-bit RSA (4) 4096-bit RSA

hash_type	Input	Hash type
		R_TSIP_RSA_HASH_MD5
		R_TSIP_RSA_HASH_SHA1
		R_TSIP_RSA_HASH_SHA256

Return Values

TSIP_SUCCESS:	Normal termination
TSIP_ERR_RESOURCE_CONFLICT:	Occurrence of resource conflict because a hardware resource needed by the processing routine was in use by another processing routine
TSIP_ERR_KEY_SET	Invalid wrapped key input
TSIP_ERR_AUTHENTICATION	Signature verification failure
TSIP_ERR_PARAMETER	Invalid input data
TSIP_ERR_FAIL	Occurrence of internal error (Only for XXX = 3072, 4096)

Description

R_TSIP_RsassaPkcsXXXSignatureVerification() function verifies, in accordance with RSASSAPKCS1-V1_5, the signature text input as the first parameter signature, and the message text or hash value input as the second parameter, message_hash, using the public wrapped key input as the third parameter, key_index. When a message is specified by the second parameter, message_hash->data_type, a hash value is calculated using the public wrapped key input as the third parameter, key_index, as specified by the fourth parameter, hash_type. When specifying a hash value in the second parameter, message_hash->data_type, a hash value calculated with the hash algorithm specified by the fourth parameter, hash_type, must be input as message_hash->pdata.

Refer to 3.7.1, Key Injection and Updating, for an explanation of how to generate key_index.

Reentrancy

Not supported.

4.2.6.10 R_TSIP_RsassaPssXXXSignatureGenerate**Format**

```

(1) #include "r_tsip_rx_if.h"
    e_tsip_err_t R_TSIP_RsassaPss1024SignatureGenerate(
        tsip_rsa_byte_data_t *message_hash,
        tsip_rsa_byte_data_t *signature,
        tsip_rsa1024_private_key_index_t *key_index,
        uint8_t hash_type
    )
(2) #include "r_tsip_rx_if.h"
    e_tsip_err_t R_TSIP_RsassaPss2048SignatureGenerate(
        tsip_rsa_byte_data_t *message_hash,
        tsip_rsa_byte_data_t *signature,
        tsip_rsa2048_private_key_index_t *key_index,
        uint8_t hash_type
    )

```

Parameters

message_hash	Input	Message or hash value information to which to attach signature
pdata		Specifies pointer to array containing message or hash value.
data_length		Specifies valid data length of array (specified for message only).
data_type		Selects data type of message_hash. Message: 0 Hash value: 1
signature	Output	Signature text storage destination information
pdata		Specifies pointer to array containing signature text.
data_length		Data length (byte units)
key_index	Input	Wrapped key (1) 1024-bit RSA (2) 2048-bit RSA
hash_type	Input	Hash type to attach to signature R_TSIP_RSA_HASH_SHA1 R_TSIP_RSA_HASH_SHA256

Return Values

TSIP_SUCCESS:	Normal termination
TSIP_ERR_RESOURCE_CONFLICT:	Occurrence of resource conflict because a hardware resource needed by the processing routine was in use by another processing routine
TSIP_ERR_KEY_SET	Invalid wrapped key input
TSIP_ERR_PARAMETER	Invalid input data

Description

The R_TSIP_RsassaPssXXXSignatureGenerate() function generates, in accordance with RSASSA-PSS in section 8.1 of RFC 8017, signature text from the message text or hash value input as the first parameter, message_hash, using the secret wrapped key input as the third parameter, key_index, and writes the result to the second parameter, signature. The salt length is fixed at 32 bytes.

When a message is specified as the first parameter, message_hash->data_type, a hash value is calculated from the message as specified by the fourth parameter, hash_type.

When specifying a hash value in the first parameter, message_hash->data_type, a hash value calculated with the hash algorithm specified by the fourth parameter, hash_type, must be input as message_hash->pdata.

Refer to 3.7.1, Key Injection and Updating, for an explanation of how to generate key_index.

Reentrancy

Not supported.

4.2.6.11 R_TSIP_RsassaPssXXXSignatureVerification**Format**

```

(1) #include "r_tsip_rx_if.h"
    e_tsip_err_t R_TSIP_RsassaPss1024SignatureVerification(
        tsip_rsa_byte_data_t *signature,
        tsip_rsa_byte_data_t *message_hash,
        tsip_rsa1024_public_key_index_t *key_index,
        uint8_t hash_type
    )

(2) #include "r_tsip_rx_if.h"
    e_tsip_err_t R_TSIP_RsassaPss2048SignatureVerification(
        tsip_rsa_byte_data_t *signature,
        tsip_rsa_byte_data_t *message_hash,
        tsip_rsa2048_public_key_index_t *key_index,
        uint8_t hash_type
    )

```

Parameters

signature	Input	Signature text information to be verified
pdata		Specifies pointer to array containing signature text.
message_hash	Input	Message text or hash value information to be verified
pdata		Specifies pointer to array containing message or hash value.
data_length		Specifies valid data length of array (specified for message only).
data_type		Selects data type of message_hash. Message: 0 Hash value: 1
key_index	Input	Wrappd key (1) 1024-bit RSA (2) 2048-bit RSA
hash_type	Input	Hash type R_TSIP_RSA_HASH_SHA1 R_TSIP_RSA_HASH_SHA256

Return Values

TSIP_SUCCESS:	Normal termination
TSIP_ERR_RESOURCE_CONFLICT:	Occurrence of resource conflict because a hardware resource needed by the processing routine was in use by another processing routine
TSIP_ERR_KEY_SET	Invalid wrapped key input
TSIP_ERR_AUTHENTICATION	Signature verification failure
TSIP_ERR_PARAMETER	Invalid input data

Description

The R_TSIP_RsassaPssXXXSignatureVerification() function verifies, in accordance with RSASSA-PSS, the signature text input as the first parameter signature, and the message text or hash value input as the second parameter, message_hash, using the public wrapped key input as the third parameter, key_index. The salt length is fixed at 32 bytes.

When a message is specified by the second parameter, message_hash->data_type, a hash value is calculated using the public wrapped key input as the third parameter, key_index, as specified by the fourth parameter, hash_type.

When specifying a hash value in the second parameter, message_hash->data_type, a hash value calculated with the hash algorithm specified by the fourth parameter, hash_type, must be input as message_hash->pdata.

Refer to 3.7.1, Key Injection and Updating, for an explanation of how to generate key_index.

Reentrancy

Not supported.

4.2.7 ECC

4.2.7.1 R_TSIP_GenerateEccPXXXPublicKeyIndex

Format

```

(1) #include "r_tsip_rx_if.h"

    )
(4) #include "r_tsip_rx_if.h"
    e_tsip_err_t R_TSIP_GenerateEccP384PublicKeyIndex(
        uint8_t *encrypted_provisioning_key,
        uint8_t *iv,
        uint8_t *encrypted_key,
        tsip_ecc_public_key_index_t *key_index
    )

```

Parameters

encrypted_provisioning_key	Input	W-UFPK
iv	Input	Initialization vector when generating encrypted_key
encrypted_key	Input	Encrypted key encrypted using UFPK
key_index	Output	Wrapped key
value		Public key value
key_management_info		Key management information
key_q		(1) ECC P-192 public key Q (plaintext) (2) ECC P-224 public key Q (plaintext) (3) ECC P-256 public key Q (plaintext) (4) ECC P-384 public key Q (plaintext)

Return Values

TSIP_SUCCESS:	Normal termination
TSIP_ERR_RESOURCE_CONFLICT:	Occurrence of resource conflict because a hardware resource needed by the processing routine was in use by another processing routine
TSIP_ERR_FAIL	Occurrence of internal error

Description

This API outputs an ECC P-192, P-224, P-256, or P-384 public wrapped key.

Refer to 7.3.5, ECC, for an explanation of the method used to encrypt the public key using the provisioning key input as encrypted_key.

Ensure that the areas allocated for encrypted_key and key_index do not overlap.

A structure which includes the public key plaintext data is output as key_index->value.key_q. Refer to 7.4.2, ECC, for the format.

Refer to 3.7.1, Key Injection and Updating, for an explanation of encrypted_provisioning_key, iv, and encrypted_key and how to use key_index.

Reentrancy

Not supported.

4.2.7.2 R_TSIP_GenerateEccPXXXPrivateKeyIndex**Format**

```

(1) #include "r_tsip_rx_if.h"
    e_tsip_err_t R_TSIP_GenerateEccP192PrivateKeyIndex(
        uint8_t *encrypted_provisioning_key,
        uint8_t *iv,
        uint8_t *encrypted_key,
        tsip_ecc_private_key_index_t *key_index
    )

(2) #include "r_tsip_rx_if.h"
    e_tsip_err_t R_TSIP_GenerateEccP224PrivateKeyIndex(
        uint8_t *encrypted_provisioning_key,
        uint8_t *iv,
        uint8_t *encrypted_key,
        tsip_ecc_private_key_index_t *key_index
    )

(3) #include "r_tsip_rx_if.h"
    e_tsip_err_t R_TSIP_GenerateEccP256PrivateKeyIndex(
        uint8_t *encrypted_provisioning_key,
        uint8_t *iv,
        uint8_t *encrypted_key,
        tsip_ecc_private_key_index_t *key_index
    )

(4) #include "r_tsip_rx_if.h"
    e_tsip_err_t R_TSIP_GenerateEccP384PrivateKeyIndex(
        uint8_t *encrypted_provisioning_key,
        uint8_t *iv,
        uint8_t *encrypted_key,
        tsip_ecc_private_key_index_t *key_index
    )

```

Parameters

encrypted_provisioning_key	Input	W-UFPK
iv	Input	Initialization vector when generating encrypted_key
encrypted_key	Input	Encrypted key encrypted using UFPK
key_index	Output	Wrapped key (1) ECC P-192 secret wrapped key (2) ECC P-224 secret wrapped key (3) ECC P-256 secret wrapped key (4) ECC P-384 secret wrapped key

Return Values

TSIP_SUCCESS:	Normal termination
TSIP_ERR_RESOURCE_CONFLICT:	Occurrence of resource conflict because a hardware resource needed by the processing routine was in use by another processing routine
TSIP_ERR_FAIL	Occurrence of internal error

Description

This API outputs an ECC P-192, P-224, P-256, or P-384 secret wrapped key.

Refer to 7.4, Public Key Index Formats for Asymmetric Cryptography, for the format of the data encrypted using the UFPK input as encrypted_key.

Ensure that the areas allocated for encrypted_key and key_index do not overlap.

Refer to 3.7.1, Key Injection and Updating, for an explanation of encrypted_provisioning_key, iv, and encrypted_key and how to use key_index.

Reentrancy

Not supported.

| key_q               |        | Public key (Qx    Qy) (plaintext)                   |
|                     |        | (1) ECC P-192                                       |
|                     |        | (2) ECC P-224                                       |
|                     |        | (3) ECC P-256                                       |
|                     |        | (4) ECC P-384                                       |

**Return Values**

|                             |                                                                                                                                       |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| TSIP_SUCCESS:               | Normal termination                                                                                                                    |
| TSIP_ERR_RESOURCE_CONFLICT: | Occurrence of resource conflict because a hardware resource needed by the processing routine was in use by another processing routine |
| TSIP_ERR_FAIL               | Occurrence of internal error                                                                                                          |

**Description**

This API updates an ECC P-192, P-224, P-256, or P-384 public wrapped key.

Refer to 7.3.5, ECC, for an explanation of the method and format used to encrypt the public key using the KUK input as encrypted\_key.

Refer to 7.4.2, ECC, for the format of the public key Q plaintext data output as key\_index->value.key\_q.

Refer to 3.7.1, Key Injection and Updating, for an explanation of iv and encrypted\_key and how to use key\_index.

### **Reentrancy**

Not supported.

**4.2.7.4 R\_TSIP\_UpdateEccPXXXPrivateKeyIndex****Format**

- ```
(1) #include "r_tsip_rx_if.h"
    e_tsip_err_t R_TSIP_UpdateEccP192PrivateKeyIndex(
        uint8_t *iv,
        uint8_t *encrypted_key,
        tsip_ecc_private_key_index_t *key_index
    )

(2) #include "r_tsip_rx_if.h"
    e_tsip_err_t R_TSIP_UpdateEccP224PrivateKeyIndex(
        uint8_t *iv,
        uint8_t *encrypted_key,
        tsip_ecc_private_key_index_t *key_index
    )

(3) #include "r_tsip_rx_if.h"
    e_tsip_err_t R_TSIP_UpdateEccP256PrivateKeyIndex(
        uint8_t *iv,
        uint8_t *encrypted_key,
        tsip_ecc_private_key_index_t *key_index
    )

(4) #include "r_tsip_rx_if.h"
    e_tsip_err_t R_TSIP_UpdateEccP384PrivateKeyIndex(
        uint8_t *iv,
        uint8_t *encrypted_key,
        tsip_ecc_private_key_index_t *key_index
    )
```

Parameters

iv	Input	Initialization vector when generating encrypted_key
encrypted_key	Input	Encrypted key encrypted using KUK
key_index	Output	Wrapped key (1) ECC P-192 secret key (2) ECC P-224 secret key (3) ECC P-256 secret key (4) ECC P-384 secret key

Return Values

TSIP_SUCCESS:	Normal termination
TSIP_ERR_RESOURCE_CONFLICT:	Occurrence of resource conflict because a hardware resource needed by the processing routine was in use by another processing routine
TSIP_ERR_FAIL	Occurrence of internal error

Description

This API updates an ECC P-192, P-224, P-256, or P-384 secret wrapped key.

Refer to 7.3.5, ECC, for an explanation of the method and format used to encrypt the private key using the KUK input as encrypted_key.

Refer to 3.7.1, Key Injection and Updating, for an explanation of iv and encrypted_key and how to use key_index.

Reentrancy

Not supported.

4.2.7.5 R_TSIP_GenerateEccPXXXRandomKeyIndex**Format**

- ```

| ->private           |        | Secret wrapped key                                                                                              |

**Return Values**

|                             |                                                                                                                                       |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| TSIP_SUCCESS:               | Normal termination                                                                                                                    |
| TSIP_ERR_RESOURCE_CONFLICT: | Occurrence of resource conflict because a hardware resource needed by the processing routine was in use by another processing routine |
| TSIP_ERR_FAIL               | Occurrence of internal error                                                                                                          |

**Description**

This API outputs P-192, P-224, P-256, or P-384 wrapped keys for an ECC public key–secret key pair. The API generates a user key from a random number within the TSIP. Therefore, no user key needs to be input. Encrypting data using the wrapped keys output by this API makes it possible to prevent dead copying of data. The public wrapped key is generated in `key_pair_index->public`, and the secret wrapped key is generated in `key_pair_index->private`. The plaintext public key is output to `key_pair_index->public.value.key_q`. Refer to 7.4, Public Key Index Formats for Asymmetric Cryptography, for the data format.

Refer to 3.7.1, Key Injection and Updating, for an explanation of how to use `key_pair_index->public` and `key_pair_index->private`. The parameter `key_pair_index->public` is utilized in the same manner as the public wrapped key output by `R_TSIP_GenerateEccPXXXPublicKeyIndex()`, and `key_pair_index->private` is utilized in the same manner as the secret wrapped key output by `R_TSIP_GenerateEccPXXXPrivateKeyIndex()`.

**Reentrancy**

Not supported.

**4.2.7.6 R\_TSIP\_EcdsaPXXXSignatureGenerate****Format**

```

(1) #include "r_tsip_rx_if.h"
 e_tsip_err_t R_TSIP_EcdsaP192SignatureGenerate(
 tsip_ecdsa_byte_data_t *message_hash,
 tsip_ecdsa_byte_data_t *signature,
 tsip_ecc_private_key_index_t *key_index
)
(2) #include "r_tsip_rx_if.h"
 e_tsip_err_t R_TSIP_EcdsaP224SignatureGenerate(
 tsip_ecdsa_byte_data_t *message_hash,
 tsip_ecdsa_byte_data_t *signature,
 tsip_ecc_private_key_index_t *key_index
)
(3) #include "r_tsip_rx_if.h"

### Return Values

|                             |                                                                                                                                       |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| TSIP_SUCCESS:               | Normal termination                                                                                                                    |
| TSIP_ERR_RESOURCE_CONFLICT: | Occurrence of resource conflict because a hardware resource needed by the processing routine was in use by another processing routine |
| TSIP_ERR_KEY_SET            | Invalid wrapped key index input                                                                                                       |
| TSIP_ERR_FAIL               | Occurrence of internal error                                                                                                          |
| TSIP_ERR_PARAMETER          | Invalid input data                                                                                                                    |

### Description

When using (1) R\_TSIP\_EcdsaP192SignatureGenerate, (2) R\_TSIP\_EcdsaP224SignatureGenerate, or (3) R\_TSIP\_EcdsaP256SignatureGenerate

When a message is specified by the first parameter, message\_hash->data\_type, an SHA-256 hash of the message text input as the first parameter, message\_hash->pdata, is calculated, and the signature text is written to the second parameter, signature, in accordance with ECDSA P-192, P-224, or P-256 using the secret wrapped key input as the third parameter, key\_index.

When a hash value is specified by the first parameter, message\_hash->data\_type, the signature text for the first XXX bits (XXX/8 bytes) of the SHA-256 hash value input as the first parameter, message\_hash->pdata, is written to the second parameter, signature, in accordance with ECDSA P-192, P-224, or P-256 using the secret wrapped key input as the third parameter, key\_index.

When using (4) R\_TSIP\_EcdsaP384SignatureGenerate

The signature text for the entire 48 bytes of the SHA-384 hash value input as the first parameter, message\_hash->pdata, is written to the second parameter, signature, in accordance with ECDSA P-384 using the secret wrapped key input as the third parameter, key\_index.

Refer to 3.7.1, Key Injection and Updating, for an explanation of how to generate key\_index.

| TSIP_ERR_RESOURCE_CONFLICT: | Occurrence of resource conflict because a hardware resource needed by the processing routine was in use by another processing routine |
| TSIP_ERR_KEY_SET            | Invalid wrapped key index input                                                                                                       |
| TSIP_ERR_FAIL               | Internal error, or signature verification failure                                                                                     |
| TSIP_ERR_PARAMETER          | Invalid input data                                                                                                                    |

### Description

When using (1) R\_TSIP\_EcdsaP192SignatureVerification, (2) R\_TSIP\_EcdsaP224SignatureVerification, or (3) R\_TSIP\_EcdsaP256SignatureVerification

When a message is specified by the second parameter, message\_hash->data\_type, an SHA-256 hash of the message text input as the second parameter, message\_hash->pdata, is calculated, and the signature text input as the first parameter, signature, is validated in accordance with ECDSA P-192, P-224 or P-256 using the public wrapped key input as the third parameter, key\_index.

When a hash value is specified by the second parameter, message\_hash->data\_type, the signature text for the first XXX bits (XXX/8 bytes) of the SHA-256 hash value input as the second parameter, message\_hash->pdata, and the signature text input as the first parameter, signature, is validated in accordance with ECDSA P-192, P-224 or P-256 using the public wrapped key input as the third parameter, key\_index.

When using (4) R\_TSIP\_EcdsaP384SignatureVerification

The signature text for the entire 48 bytes of the SHA-384 hash value input as the second parameter, message\_hash->pdata, and the signature text input as the first parameter, signature, is validated in accordance with ECDSA P-384 using the public wrapped key input as the third parameter, key\_index.

Refer to 3.7.1, Key Injection and Updating, for an explanation of how to generate key\_index.

### Reentrancy

Not supported.

## 4.2.8 HASH

---

### 4.2.8.1 R\_TSIP\_ShaXXXInit

---

#### Format

- ```
(1) #include "r_tsip_rx_if.h"
    e_tsip_err_t R_TSIP_Sha1Init(
        tsip_sha_md5_handle_t *handle
    )

(2) #include "r_tsip_rx_if.h"
    e_tsip_err_t R_TSIP_Sha256Init(
        tsip_sha_md5_handle_t *handle
    )
```

Parameters

handle	Output	SHA handler (work area)
--------	--------	-------------------------

Return Values

TSIP_SUCCESS:	Normal termination
---------------	--------------------

Description

The R_TSIP_ShaXXXInit() function performs preparations for the execution of an SHA1 or SHA256 hash calculation, and writes the result to the first parameter, handle. The parameter handle is used subsequently as a parameter by the R_TSIP_ShaXXXUpdate() and R_TSIP_ShaXXXFinal() functions.

Reentrancy

Not supported.

4.2.8.2 R_TSIP_ShaXXXUpdate**Format**

```

(1) #include "r_tsip_rx_if.h"
    e_tsip_err_t R_TSIP_Sha1Update(
        tsip_sha_md5_handle_t *handle,
        uint8_t *message,
        uint32_t message_length
    )
(2) #include "r_tsip_rx_if.h"
    e_tsip_err_t R_TSIP_Sha256Update(
        tsip_sha_md5_handle_t *handle,
        uint8_t *message,
        uint32_t message_length
    )

```

Parameters

handle	Input/output	SHA handler (work area)
message	Input	Message area
message_length	Input	Byte length of message

Return Values

TSIP_SUCCESS:	Normal termination
TSIP_ERR_RESOURCE_CONFLICT:	Occurrence of resource conflict because a hardware resource needed by the processing routine was in use by another processing routine
TSIP_ERR_PARAMETER:	Invalid handle input
TSIP_ERR_PROHIBIT_FUNCTION:	Invalid function called

Description

Using the handle specified by the first parameter, handle, the R_TSIP_ShaXXXUpdate() function calculates a hash value based on the second parameter, message, and the third parameter, message_length, and writes the ongoing status to the first parameter, handle (the value of which can be fetched using R_TSIP_GetCurrentHashDigestValue()). After message input completes, call R_TSIP_ShaXXXFinal().

Reentrancy

Not supported.

4.2.8.3 R_TSIP_ShaXXXFinal**Format**

```

(1) #include "r_tsip_rx_if.h"
    e_tsip_err_t R_TSIP_Sha1Final(
        tsip_sha_md5_handle_t *handle,
        uint8_t *digest,
        uint32_t *digest_length
    )
(2) #include "r_tsip_rx_if.h"
    e_tsip_err_t R_TSIP_Sha256Final(
        tsip_sha_md5_handle_t *handle,
        uint8_t *digest,
        uint32_t *digest_length
    )

```

Parameters

handle	Input	SHA handler (work area)
digest	Output	Hash data area
digest_length	Output	Byte length of hash data (1) SHA1: 20 bytes (2) SHA256: 32 bytes

Return Values

TSIP_SUCCESS:	Normal termination
TSIP_ERR_RESOURCE_CONFLICT:	Occurrence of resource conflict because a hardware resource needed by the processing routine was in use by another processing routine
TSIP_ERR_PARAMETER:	Invalid handle input
TSIP_ERR_PROHIBIT_FUNCTION:	Invalid function called

Description

Using the handle specified as the first parameter, handle, the R_TSIP_ShaXXXFinal() function writes the calculation result to the second parameter, digest, and writes the length of the calculation result to the third parameter, digest_length.

Reentrancy

Not supported.

4.2.8.4 R_TSIP_Md5Init

Format

```
#include "r_tsip_rx_if.h"
e_tsip_err_t R_TSIP_Md5Init(
    tsip_sha_md5_handle_t *handle
)
```

Parameters

handle	Output	MD5 handler (work area)
--------	--------	-------------------------

Return Values

TSIP_SUCCESS:	Normal termination
---------------	--------------------

Description

The R_TSIP_Md5Init() function performs preparations for the execution of hash calculation and writes the result to the first parameter, handle. The parameter handle is used subsequently as a parameter by the R_TSIP_Md5Update() and R_TSIP_Md5Final() functions.

Reentrancy

Not supported.

4.2.8.5 R_TSIP_Md5Update

Format

```
#include "r_tsip_rx_if.h"
e_tsip_err_t R_TSIP_Md5Update(
    tsip_sha_md5_handle_t *handle,
    uint8_t *message,
    uint32_t message_length
)
```

Parameters

handle	Input/output	MD5 handler (work area)
message	Input	Message area
message_length	Input	Byte length of message

Return Values

TSIP_SUCCESS:	Normal termination
TSIP_ERR_RESOURCE_CONFLICT:	Occurrence of resource conflict because a hardware resource needed by the processing routine was in use by another processing routine
TSIP_ERR_PARAMETER:	Invalid handle input
TSIP_ERR_PROHIBIT_FUNCTION:	Invalid function called

Description

Using the handle specified by the first parameter, handle, the R_TSIP_Md5Update() function calculates a hash value based on the second parameter, message, and the third parameter, message_length, and writes the ongoing status to the first parameter, handle (the value of which can be fetched using R_TSIP_GetCurrentHashDigestValue()). After message input completes, call R_TSIP_Md5Final().

Reentrancy

Not supported.

4.2.8.6 R_TSIP_Md5Final

Format

```
#include "r_tsip_rx_if.h"
e_tsip_err_t R_TSIP_Sha1Final(
    tsip_sha_md5_handle_t *handle,
    uint8_t *digest,
    uint32_t *digest_length
)
```

Parameters

handle	Input	MD5 handler (work area)
digest	Output	Hash data area
digest_length	Output	Byte length of hash data (16 bytes)

Return Values

TSIP_SUCCESS:	Normal termination
TSIP_ERR_RESOURCE_CONFLICT:	Occurrence of resource conflict because a hardware resource needed by the processing routine was in use by another processing routine
TSIP_ERR_PARAMETER:	Invalid handle input
TSIP_ERR_PROHIBIT_FUNCTION:	Invalid function called

Description

Using the handle specified as the first parameter, handle, the R_TSIP_Md5Final() function writes the calculation result to the second parameter, digest, and writes the length of the calculation result to the third parameter, digest_length.

Reentrancy

Not supported.

4.2.8.7 R_TSIP_GetCurrentHashDigestValue

Format

```
#include "r_tsip_rx_if.h"
e_tsip_err_t R_TSIP_GetCurrentHashDigestValue(
    tsip_sha_md5_handle_t *handle,
    uint8_t *digest,
    uint32_t *digest_length
)
```

Parameters

handle	Input	SHA or MD5 handler (work area)
digest	Output	Hash value for current input data area
digest_length	Output	Hash value for current input data length (16, 20, or 32 bytes)

Return Values

TSIP_SUCCESS:	Normal termination
TSIP_ERR_PARAMETER:	Invalid handle input
TSIP_ERR_PROHIBIT_FUNCTION:	Invalid function called

Description

Using the handle specified as the parameter handle, this function outputs to the parameter digest the hash value for current input data after execution of an Update() function*¹ and outputs to the parameter digest_length the data length.

Note: 1. R_TSIP_Sha1Update(), R_TSIP_Sha256Update(), or R_TSIP_Md5Update() function

Reentrancy

Not supported.

4.2.9 HMAC

4.2.9.1 R_TSIP_GenerateShaXXXHmacKeyIndex

Format

```
(1) #include "r_tsip_rx_if.h"
    e_tsip_err_t R_TSIP_GenerateSha1HmacKeyIndex (
        uint8_t *encrypted_provisioning_key,
        uint8_t *iv,
        uint8_t *encrypted_key,
        tsip_hmac_sha_key_index_t *key_index
    )
(2) #include "r_tsip_rx_if.h"
    e_tsip_err_t R_TSIP_GenerateSha256HmacKeyIndex (
        uint8_t *encrypted_provisioning_key,
        uint8_t *iv,
        uint8_t *encrypted_key,
        tsip_hmac_sha_key_index_t *key_index
    )
```

Parameters

encrypted_provisioning_key	Input	W-UFPK
iv	Input	Initialization vector when generating encrypted_key
encrypted_key	Input	Encrypted key encrypted using UFPK
key_index	Output	Wrapped key

Return Values

TSIP_SUCCESS:	Normal termination
TSIP_ERR_FAIL:	Occurrence of internal error
TSIP_ERR_RESOURCE_CONFLICT:	Occurrence of resource conflict because a hardware resource needed by the processing routine was in use by another processing routine

Description

This API outputs an SHA1-HMAC or SHA256-HMAC wrapped key.

Refer to 7.3.6, SHA-HMAC, for the format of the data encrypted using the UFPK input as encrypted_key.

Refer to 3.7.1, Key Injection and Updating, for an explanation of encrypted_provisioning_key, iv, and encrypted_key and how to use key_index.

Reentrancy

Not supported.

4.2.9.2 R_TSIP_UpdateShaXXXHmacKeyIndex**Format**

```

(1) #include "r_tsip_rx_if.h"
    e_tsip_err_t R_TSIP_UpdateSha1HmacKeyIndex (
        uint8_t *iv,
        uint8_t *encrypted_key,
        tsip_hmac_sha_key_index_t *key_index
    )
(2) #include "r_tsip_rx_if.h"
    e_tsip_err_t R_TSIP_UpdateSha256HmacKeyIndex (
        uint8_t *iv,
        uint8_t *encrypted_key,
        tsip_hmac_sha_key_index_t *key_index
    )

```

Parameters

iv	Input	Initialization vector when generating encrypted_key
encrypted_key	Input	Encrypted key encrypted using KUK
key_index	Output	Wrapped key

Return Values

TSIP_SUCCESS:	Normal termination
TSIP_ERR_FAIL:	Occurrence of internal error
TSIP_ERR_RESOURCE_CONFLICT:	Occurrence of resource conflict because a hardware resource needed by the processing routine was in use by another processing routine

Description

This API updates a SHA-HMAC wrapped key.

Refer to 7.3.6, SHA-HMAC for the format of the data encrypted using the KUK input as encrypted_key.

Refer to 3.7.1, Key Injection and Updating, for an explanation of encrypted_provisioning_key, iv, and encrypted_key and how to use key_index.

Reentrancy

Not supported.

4.2.9.3 R_TSIP_ShaXXXHmacGenerateInit**Format**

```
(1) #include "r_tsip_rx_if.h"
    e_tsip_err_t R_TSIP_Sha1HmacGenerateInit(
        tsip_hmac_sha_handle_t *handle,
        tsip_hmac_sha_key_index_t *key_index
    )
(2) #include "r_tsip_rx_if.h"
    e_tsip_err_t R_TSIP_Sha256HmacGenerateInit(
        tsip_hmac_sha_handle_t *handle,
        tsip_hmac_sha_key_index_t *key_index
    )
```

Parameters

handle	Output	SHA-HMAC handler (work area)
key_index	Input	Wrapped key

Return Values

TSIP_SUCCESS:	Normal termination
TSIP_ERR_RESOURCE_CONFLICT:	Occurrence of resource conflict because a hardware resource needed by the processing routine was in use by another processing routine
TSIP_ERR_KEY_SET:	Invalid wrapped key input

Description

The R_TSIP_ShaXXXHmacGenerateInit() function uses the second parameter, key_index, to perform preparations for the execution of SHA1-HMAC or SHA256-HMAC calculation and writes the result to the first parameter, handle. When using the TLS cooperation function, use the wrapped key generated by the R_TSIP_TlsGenerateSessionKey() function as key_index. The parameter handle is used subsequently as a parameter by the R_TSIP_ShaXXXHmacGenerateUpdate() and R_TSIP_ShaXXXHmacGenerateFinal() functions.

Refer to 3.7.1, Key Injection and Updating, for an explanation of how to generate key_index.

Reentrancy

Not supported.

4.2.9.4 R_TSIP_ShaXXXHmacGenerateUpdate**Format**

```

(1) #include "r_tsip_rx_if.h"
    e_tsip_err_t R_TSIP_Sha1HmacGenerateUpdate(
        tsip_hmac_sha_handle_t *handle,
        uint8_t *message,
        uint32_t message_length
    )
(2) #include "r_tsip_rx_if.h"
    e_tsip_err_t R_TSIP_Sha256HmacGenerateUpdate(
        tsip_hmac_sha_handle_t *handle,
        uint8_t *message,
        uint32_t message_length
    )

```

Parameters

handle	Input/output	SHA-HMAC handler (work area)
message	Input	Message area
message_length	Input	Byte length of message

Return Values

TSIP_SUCCESS:	Normal termination
TSIP_ERR_PARAMETER:	Invalid handle input
TSIP_ERR_PROHIBIT_FUNCTION:	Invalid function called

Description

Using the handle specified by the first parameter, handle, the R_TSIP_ShaXXXHmacGenerateUpdate() function calculates a hash value based on the second parameter, message, and the third parameter, message_length, and writes the ongoing status to the first parameter, handle. After message input completes, call R_TSIP_ShaXXXHmacGenerateFinal().

Reentrancy

Not supported.

4.2.9.5 R_TSIP_ShaXXXHmacGenerateFinal

Format

- ```
(1) #include "r_tsip_rx_if.h"
 e_tsip_err_t R_TSIP_Sha1HmacGenerateFinal(
 tsip_hmac_sha_handle_t *handle,
 uint8_t *mac
)
(2) #include "r_tsip_rx_if.h"
 e_tsip_err_t R_TSIP_Sha256HmacGenerateFinal(
 tsip_hmac_sha_handle_t *handle,
 uint8_t *mac
)
```

##### Parameters

|        |        |                                                                   |
|--------|--------|-------------------------------------------------------------------|
| handle | Input  | SHA-HMAC handler (work area)                                      |
| mac    | Output | HMAC area<br>(1) SHA1-HMAC: 20 bytes<br>(2) SHA256-HMAC: 32 bytes |

##### Return Values

|                             |                              |
|-----------------------------|------------------------------|
| TSIP_SUCCESS:               | Normal termination           |
| TSIP_ERR_FAIL:              | Occurrence of internal error |
| TSIP_ERR_PARAMETER:         | Invalid handle input         |
| TSIP_ERR_PROHIBIT_FUNCTION: | Invalid function called      |

##### Description

The R\_TSIP\_ShaXXXHmacGenerateFinal() function uses the handle specified as the first parameter, handle, and writes the calculation result to the second parameter, mac.

##### Reentrancy

Not supported.

---

**4.2.9.6 R\_TSIP\_ShaXXXHmacVerifyInit**

---

**Format**

```

(1) #include "r_tsip_rx_if.h"
 e_tsip_err_t R_TSIP_Sha1HmacVerifyInit(

| TSIP_ERR_PARAMETER:         | Invalid handle input         |
| TSIP_ERR_PROHIBIT_FUNCTION: | Invalid function called      |

**Description**

Using the handle specified as the first parameter, handle, the R\_TSIP\_ShaXXXHmacVerifyFinal() function verifies the MAC value based on the second parameter, mac, and the third parameter, mac\_length. The value of mac\_length is specified in byte units. Input a value of 4 to 20 for SHA1-HMAC and 4 to 32 for SHA256-HMAC.

**Reentrancy**

Not supported.

## 4.2.10 DH

### 4.2.10.1 R\_TSIP\_Rsa2048DhKeyAgreement

#### Format

```
#include "r_tsip_rx_if.h"
e_tsip_err_t R_TSIP_Rsa2048DhKeyAgreement(
 tsip_aes_key_index_t *key_index,
 tsip_rsa2048_private_key_index_t *sender_private_key_index,
 uint8_t *message,
 uint8_t *receiver_modulus,
 uint8_t *sender_modulus
)
```

#### Parameters

|                          |        |                                                                                                                                          |
|--------------------------|--------|------------------------------------------------------------------------------------------------------------------------------------------|
| key_index                | Input  | Wrapped key for AES-128 CMAC operation                                                                                                   |
| sender_private_key_index | Input  | Secret wrapped key for DH operation<br>The secret key d included in the secret wrapped key is decrypted and used internally by the TSIP. |
| message                  | Input  | Message (2048 bits)<br>Set a value smaller than the prime number (d) included in sender_private_key_index.                               |
| receiver_modulus         | Input  | Modular exponentiation result calculated by the receiver + MAC<br>2048-bit modular exponentiation result    128 bits                     |
| sender_modulus           | Output | Modular exponentiation result calculated by the sender + MAC<br>2048-bit modular exponentiation result    128 bits                       |

#### Return Values

|                             |                                                                                                                                       |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| TSIP_SUCCESS:               | Normal termination                                                                                                                    |
| TSIP_ERR_KEY_SET:           | Invalid wrapped key input                                                                                                             |
| TSIP_ERR_RESOURCE_CONFLICT: | Occurrence of resource conflict because a hardware resource needed by the processing routine was in use by another processing routine |
| TSIP_ERR_FAIL:              | Occurrence of internal error                                                                                                          |

#### Description

Performs a DH operation using RSA-2048.

The sender is the TSIP and the receiver is the other key exchange party.

#### Reentrancy

Not supported.

## 4.2.11 ECDH

---

### 4.2.11.1 R\_TSIP\_EcdhP256Init

---

#### Format

```
#include "r_tsip_rx_if.h"
e_tsip_err_t R_TSIP_EcdhP256Init (
 tsip_ecdh_handle_t *handle,
 uint32_t key_type,
 uint32_t use_key_id
)
```

#### Parameters

|             |        |                                          |
|-------------|--------|------------------------------------------|
| handle      | Output | ECDH handler (work area)                 |
| key_type    | Input  | Key exchange type    0: ECDHE<br>1: ECDH |
| user_key_id | Input  | 0: key_id not used<br>1: key_id used     |

#### Return Values

|                     |                    |
|---------------------|--------------------|
| TSIP_SUCCESS:       | Normal termination |
| TSIP_ERR_PARAMETER: | Invalid input data |

#### Description

The R\_TSIP\_EcdhP256Init() function performs preparations for the execution of ECDH key exchange calculation and writes the result to the first parameter, handle. The parameter handle is used subsequently as a parameter by the R\_TSIP\_EcdhP256ReadPublicKey(), R\_TSIP\_EcdhP256MakePublicKey(), R\_TSIP\_EcdhP256CalculateSharedSecretIndex(), and R\_TSIP\_EcdhP256KeyDerivation() functions.

Use the second parameter, key\_type, to select the type of ECDH key exchange. For ECDHE, the R\_TSIP\_EcdhP256MakePublicKey() function uses the TSIP's random number generation functionality to generate an ECC P-256 key pair. For ECDH, keys injected beforehand are used for key exchange.

Input 1 as the third parameter, use\_key\_id, to use key\_id when key exchange is performed. The key\_id parameter is for applications conforming to the DLMS/COSEM standard for smart meters.

Refer to 3.7.1, Key Injection and Updating, for an explanation of how to generate key\_index.

**Description**

The R\_TSIP\_EcdhP256ReadPublicKey() function verifies the signature of the ECC P-256 public key of the other ECDH key exchange party. If the signature is correct, it outputs the public\_key\_data wrapped key as the fifth parameter.

The first parameter, handle, is used subsequently as a parameter by the R\_TSIP\_EcdhP256CalculateSharedSecretIndex() function.

The R\_TSIP\_EcdhP256CalculateSharedSecretIndex() function uses key\_index as input to calculate Z. Refer to 3.7.1, Key Injection and Updating, for an explanation of how to generate key\_index.

**Reentrancy**

Not supported.

### **Description**

The `R_TSIP_EcdhP256MakePublicKey()` function generates an ephemeral key pair and calculates a signature using a key that is either generated or input. The generated signature is for applications conforming to the DLMS/COSEM standard for smart meters.

If ECDHE is specified by the `key_type` parameter of the `R_TSIP_EcdhP256Init()` function, the TSIP's random number generation functionality is used to generate an ECC P-256 key pair. The public key is output to `public_key` and the secret key is output to `key_index`.

If ECDH is specified by the `key_type` parameter of the `R_TSIP_EcdhP256Init()` function, the public key input as `public_key_index` is output to `public_key` and nothing is output to `key_index`.

The value of the first parameter, `handle`, is used subsequently as a parameter by the `R_TSIP_EcdhP256CalculateSharedSecretIndex()` function.

The `R_TSIP_EcdhP256CalculateSharedSecretIndex()` function uses `key_index` as input to calculate `Z`.

Refer to 3.7.1, Key Injection and Updating, for an explanation of how to generate `key_index`.

### **Reentrancy**

**Description**

The R\_TSIP\_EcdhP256CalculateSharedSecretIndex() function uses the ECDH key exchange algorithm to output the wrapped key of the shared secret Z derived from the public key of the other key exchange party and your own secret key.

As the second parameter, public\_key\_index, input the key\_index, public wrapped key whose signature was verified by R\_TSIP\_EcdhP256ReadPublicKey() function.

If the value of the key\_type parameter of R\_TSIP\_EcdhP256Init() function is 0, input the key\_index, secret wrapped key generated from a random number by R\_TSIP\_EcdhP256MakePublicKey() function as the third parameter, private\_key\_index, and if the value of the key\_type is other than 0, input the secret wrapped key corresponding to the second parameter of R\_TSIP\_EcdhP256MakePublicKey() as the third parameter, private\_key\_index.

The R\_TSIP\_EcdhP256KeyDerivation() function subsequently uses shared\_secret\_index as key material for outputting the wrapped key.

Refer to 3.7.1, Key Injection and Updating, for an explanation of how to generate key\_index.

**Reentrancy**

Not supported.

| TSIP_ERR_RESOURCE_CONFLICT: | Occurrence of resource conflict because a hardware resource needed by the processing routine was in use by another processing routine |
| TSIP_ERR_KEY_SET:           | Invalid wrapped key input                                                                                                             |
| TSIP_ERR_PARAMETER:         | Invalid handle input                                                                                                                  |
| TSIP_ERR_PROHIBIT_FUNCTION: | Invalid function called                                                                                                               |

**Description**

The R\_TSIP\_EcdhP256KeyDerivation() function uses the shared secret Z (shared\_secret\_index) calculated by the R\_TSIP\_EcdhP256CalculateSharedSecretIndex() function as key material to derive the wrapped key specified by the third parameter, key\_type. The key derivation algorithm is one-step key derivation as defined in NIST SP800-56C. Any of AES-128, AES-256 or SHA-256 HMAC is specified by the fourth parameter, kdf\_type. When SHA-256 HMAC is specified, the wrapped key output by the R\_TSIP\_GenerateSha256HmacKeyIndex() function or R\_TSIP\_UpdateSha256HmacKeyIndex() function is specified as the seventh parameter, salt\_key\_index.

Enter a fixed value for deriving a key shared with the other key exchange party as the fifth parameter, other\_info.

A key index corresponding to key\_type is output as the eighth parameter, key\_index. The correspondences between the types of derived key indexes and the functions with which they can be used as listed below.

| Derived Wrapped Key | Compatible Functions                                              |
|---------------------|-------------------------------------------------------------------|
| AES-128             | All AES-128 Init functions and R_TSIP_Aes128KeyUnwrap()           |
| AES-256             | All AES-256 Init functions and R_TSIP_Aes256KeyUnwrap()           |
| SHA256-HMAC         | R_TSIP_Sha256HmacGenerateInit() and R_TSIP_Sha256HmacVerifyInit() |

| TSIP_ERR_KEY_SET:           | Invalid wrapped key input                                                                                                                   |
| TSIP_ERR_FAIL:              | Occurrence of internal error                                                                                                                |

##### Description

Performs an ECDHE operation after generation of a key pair using Brainpool P512r1.

The sender is the TSIP and the receiver is the other key exchange party.

##### Reentrancy

Not supported.

## 4.2.12 Key Wrap

### 4.2.12.1 R\_TSIP\_AesXXXKeyWrap

#### Format

```

(1) #include "r_tsip_rx_if.h"
 e_tsip_err_t R_TSIP_Aes128KeyWrap (
 tsip_aes_key_index_t *wrap_key_index,
 uint32_t target_key_type,
 tsip_aes_key_index_t *target_key_index,
 uint32_t *wrapped_key
)
(2) #include "r_tsip_rx_if.h"
 e_tsip_err_t R_TSIP_Aes256KeyWrap (
 tsip_aes_key_index_t *wrap_key_index,
 uint32_t target_key_type,
 tsip_aes_key_index_t *target_key_index,
 uint32_t *wrapped_key
)

```

#### Parameters

|                  |        |                                                                                                        |
|------------------|--------|--------------------------------------------------------------------------------------------------------|
| wrap_key_index   | Input  | (1) AES-128 wrapped key used for wrapping<br>(2) AES-256 wrapped key used for wrapping                 |
| target_key_type  | Input  | Selects key to be wrapped.<br>0 (R_TSIP_KEYWRAP_AES128): AES-128<br>2 (R_TSIP_KEYWRAP_AES256): AES-256 |
| target_key_index | Input  | Wrapped key to be wrapped<br>target_key_type 0: 13 word size<br>target_key_type 2: 17 word size        |
| wrapped_key      | Output | Key which is wrapped<br>target_key_type 0: 6 word size<br>target_key_type 2: 10 word size              |

#### Return Values

|                             |                                                                                                                                       |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| TSIP_SUCCESS:               | Normal termination                                                                                                                    |
| TSIP_ERR_RESOURCE_CONFLICT: | Occurrence of resource conflict because a hardware resource needed by the processing routine was in use by another processing routine |
| TSIP_ERR_KEY_SET            | Invalid wrapped key input                                                                                                             |
| TSIP_ERR_FAIL               | Occurrence of internal error                                                                                                          |

#### Description

The R\_TSIP\_AesXXXKeyWrap() function uses the first parameter, wrap\_key\_index, to wrap target\_key\_index, which is input as the third parameter. The wrapped key is written to the fourth parameter, wrapped\_key. The processing conforms to the RFC 3394 wrapping algorithm. Use the second parameter, target\_key\_type, to select the key to be wrapped.

Use R\_TSIP\_Aes128KeyWrap() when the key length used for wrapping is 128 bits, and use R\_TSIP\_Aes256KeyWrap() when the key length is 256 bits.

**Reentrancy**

Not supported.

**4.2.12.2 R\_TSIP\_AesXXXKeyUnwrap****Format**

```

(1) #include "r_tsip_rx_if.h"

 tsip_aes_key_index_t *wrap_key_index,
 uint32_t target_key_type,
 uint32_t *wrapped_key,
 tsip_aes_key_index_t *target_key_index
)
(2) #include "r_tsip_rx_if.h"
 e_tsip_err_t R_TSIP_Aes256KeyUnwrap (
 tsip_aes_key_index_t *wrap_key_index,
 uint32_t target_key_type,
 uint32_t *wrapped_key,
 tsip_aes_key_index_t *target_key_index
)

```

**Parameters**

|                  |        |                                                                                                          |
|------------------|--------|----------------------------------------------------------------------------------------------------------|
| wrap_key_index   | Input  | (1) AES-128 wrapped key used for unwrapping<br>(2) AES-256 wrapped key used for unwrapping               |
| target_key_type  | Input  | Selects key to be unwrapped.<br>0 (R_TSIP_KEYWRAP_AES128): AES-128<br>2 (R_TSIP_KEYWRAP_AES256): AES-256 |
| wrapped_key      | Input  | Key which is wrapped<br>target_key_type 0: 6 word size<br>target_key_type 2: 10 word size                |
| target_key_index | Output | Unwrapped Key<br>target_key_type 0: 13 word size<br>target_key_type 2: 17 word size                      |

**Return Values**

|                             |                                                                                                                                       |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| TSIP_SUCCESS:               | Normal termination                                                                                                                    |
| TSIP_ERR_RESOURCE_CONFLICT: | Occurrence of resource conflict because a hardware resource needed by the processing routine was in use by another processing routine |
| TSIP_ERR_KEY_SET            | Invalid wrapped key input                                                                                                             |
| TSIP_ERR_FAIL               | Occurrence of internal error                                                                                                          |

**Description**

The R\_TSIP\_AesXXXKeyUnwrap() function uses the first parameter, wrap\_key\_index, to unwrap wrapped\_key, which is input as the third parameter. The unwrapped key is written to the fourth parameter, target\_key\_index. The processing conforms to the RFC 3394 unwrapping algorithm. Use the second parameter, target\_key\_type, to select the key to be unwrapped.

Use R\_TSIP\_Aes128KeyUnwrap() when the key length used for unwrapping is 128 bits, and use R\_TSIP\_Aes256KeyUnwrap() when the key length is 256 bits.

**Reentrancy**

Not supported.

### 4.2.13 TLS (Common to TLS 1.2 and TLS 1.3)

#### 4.2.13.1 R\_TSIP\_GenerateTlsRsaPublicKeyIndex

---

**Format**

```
#include "r_tsip_rx_if.h"
e_tsip_err_t R_TSIP_GenerateTlsRsaPublicKeyIndex(
 uint8_t *encrypted_provisioning_key,
 uint8_t *iv,
 uint8_t *encrypted_key,
 tsip_tls_ca_certification_public_key_index_t *key_index
)
```

**Parameters**

|                            |        |                                                                                                                                          |
|----------------------------|--------|------------------------------------------------------------------------------------------------------------------------------------------|
| encrypted_provisioning_key | Input  | W-UFPK                                                                                                                                   |
| iv                         | Input  | Initialization vector when generating encrypted_key                                                                                      |
| encrypted_key              | Input  | Encrypted key encrypted using UFPK                                                                                                       |
| key_index                  | Output | 2048-bit RSA public wrapped key for use by TLS cooperation function<br>Use this value as the key_index_1 parameter input to R_TSIP_Open. |

**Return Values**

|                            |                                                                                                                                       |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| TSIP_SUCCESS               | Normal termination                                                                                                                    |
| TSIP_ERR_FAIL              | Occurrence of internal error                                                                                                          |
| TSIP_ERR_RESOURCE_CONFLICT | Occurrence of resource conflict because a hardware resource needed by the processing routine was in use by another processing routine |

**Description**

This API outputs an RSA 2048-bit public wrapped key for use by the TLS cooperation function. Refer to 7.3.4.2(1) for the format of the data encrypted using the UFPK input as encrypted\_key. Ensure that the areas allocated for encrypted\_key and key\_index do not overlap.

Refer to 3.7.1, Key Injection and Updating, for an explanation of encrypted\_provisioning\_key, iv, and encrypted\_key and how to use key\_index.

**Reentrancy**

Not supported.

---

#### 4.2.13.2 R\_TSIP\_UpdateTlsRsaPublicKeyIndex

---

##### Format

```
#include "r_tsip_rx_if.h"
e_tsip_err_t R_TSIP_UpdateTlsRsaPublicKeyKeyIndex(
 uint8_t *iv,
 uint8_t *encrypted_key,
 tsip_tls_ca_public_key_index_t *key_index
)
```

##### Parameters

|               |        |                                                                                                                                          |
|---------------|--------|------------------------------------------------------------------------------------------------------------------------------------------|
| iv            | Input  | Initialization vector when generating encrypted_key                                                                                      |
| encrypted_key | Input  | Encrypted key encrypted using KUK                                                                                                        |
| key_index     | Output | 2048-bit RSA public wrapped key for use by TLS cooperation function<br>Use this value as the key_index_1 parameter input to R_TSIP_Open. |

##### Return Values

|                            |                                                                                                                                       |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| TSIP_SUCCESS               | Normal termination                                                                                                                    |
| TSIP_ERR_FAIL              | Occurrence of internal error                                                                                                          |
| TSIP_ERR_RESOURCE_CONFLICT | Occurrence of resource conflict because a hardware resource needed by the processing routine was in use by another processing routine |

##### Description

This API updates a 2048-bit RSA public wrapped key for use by the TLS cooperation function.

Refer to 7.3.4.2(1) for the format of the data encrypted using the KUK input as encrypted\_key.

Ensure that the areas allocated for encrypted\_key and key\_index do not overlap.

Refer to 3.7.1, Key Injection and Updating, for an explanation of encrypted\_provisioning\_key, iv, and encrypted\_key and how to use key\_index.

##### Reentrancy

Not supported.

**4.2.13.3 R\_TSIP\_TIsRootCertificateVerification****Format**

```

### Return Values

|                             |                                                                                                                                       |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| TSIP_SUCCESS:               | Normal termination                                                                                                                    |
| TSIP_ERR_FAIL:              | Occurrence of internal error                                                                                                          |
| TSIP_ERR_RESOURCE_CONFLICT: | Occurrence of resource conflict because a hardware resource needed by the processing routine was in use by another processing routine |

### Description

This API verifies the signature of a server certificate or intermediate certificate used by the TLS cooperation function.

This API can be used for same purpose as the R\_TSIP\_TlsCertificateVerificationExtension() function, but make sure to use this function when the algorithm of the key used for signature verification is the same as the algorithm used to obtain the key from the certificate.

### Reentrancy

Not supported.

**4.2.13.5 R\_TSIP\_TIsCertificateVerificationExtension****Format**

```
#include "r_tsip_rx_if.h"
e_tsip_err_t R_TSIP_TIsCertificateVerificationExtension(
 uint32_t *public_key_type,
 uint32_t *public_key_output_type,
 uint32_t *encrypted_input_public_key,
 uint8_t *certificate,
 uint32_t certificate_length,
 uint8_t *signature,
 uint32_t public_key_n_start_position,
 uint32_t public_key_n_end_position,
 uint32_t public_key_e_start_position,
 uint32_t public_key_e_end_position,
 uint32_t *encrypted_output_public_key
)
```

**Parameters**

|                            |       |                                                                                                                                                                                                                                                                                                                                                        |

**Return Values**

|                             |                                                                                                                                       |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| TSIP_SUCCESS:               | Normal termination                                                                                                                    |
| TSIP_ERR_FAIL:              | Occurrence of internal error                                                                                                          |
| TSIP_ERR_RESOURCE_CONFLICT: | Occurrence of resource conflict because a hardware resource needed by the processing routine was in use by another processing routine |

### **Description**

This API verifies the signature of a server certificate or intermediate certificate used by the TLS cooperation function.

This API can be used for same purpose as the `R_TSIP_TlsCertificateVerification()` function, but make sure to use this function when the algorithm of the key used for signature verification is different from the algorithm used to obtain the key from the certificate.

### **Reentrancy**

Not supported.

## 4.2.14 TLS (TLS 1.2)

### 4.2.14.1 R\_TSIP\_TlsGeneratePreMasterSecret

#### Format

```
#include "r_tsip_rx_if.h"
e_tsip_err_t R_TSIP_TlsGeneratePreMasterSecret(
 uint32_t *tsip_pre_master_secret
)
```

#### Parameters

|                        |        |                                                                                                                                                                                                                                                                                                                        |
|------------------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| tsip_pre_master_secret | Output | Pre-master secret data on which TSIP-specific conversion has been performed<br>Use this value as the tsip_pre_master_secret parameter input to R_TSIP_TlsGenerateMasterSecret, R_TSIP_TlsEncryptPreMasterSecretWithRsa2048PublicKey, or R_TSIP_TlsGenerateExtendedMasterSecret. 20 words (80 bytes) of data is output. |
|------------------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### Return Values

|                             |                                                                                                                                       |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| TSIP_SUCCESS:               | Normal termination                                                                                                                    |
| TSIP_ERR_RESOURCE_CONFLICT: | Occurrence of resource conflict because a hardware resource needed by the processing routine was in use by another processing routine |

#### Description

This API generates an encrypted pre-master secret for use by the TLS cooperation function.

#### Reentrancy

Not supported.

---

**4.2.14.2 R\_TSIP\_TlsEncryptPreMasterSecretWithRsa2048PublicKey**

---

**Format**

```
#include "r_tsip_rx_if.h"
e_tsip_err_t R_TSIP_TlsEncryptPreMasterSecretWithRsa2048PublicKey(
 uint32_t *encrypted_public_key,
 uint32_t *tsip_pre_master_secret,
 uint8_t *encrypted_pre_master_secret
)
```

**Parameters**

|                             |        |                                                                                                                                                                                                              |
|-----------------------------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| encrypted_public_key        | Input  | Encrypted public key data<br>Use the value of encrypted_output_public_key output by R_TSIP_TlsCertificateVerification or R_TSIP_TlsCertificateVerificationExtension. The data size is 140 words (560 bytes). |
| tsip_pre_master_secret      | Input  | Pre-master secret data on which TSIP-specific conversion has been performed, output by R_TSIP_TlsGeneratePreMasterSecret.                                                                                    |
| encrypted_pre_master_secret | Output | Pre-master secret data that was encrypted in RSA-2048 mode using public_key                                                                                                                                  |

**Return Values**

|                             |                                                                                                                                       |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| TSIP_SUCCESS:               | Normal termination                                                                                                                    |
| TSIP_ERR_FAIL:              | Occurrence of internal error                                                                                                          |
| TSIP_ERR_RESOURCE_CONFLICT: | Occurrence of resource conflict because a hardware resource needed by the processing routine was in use by another processing routine |

**Description**

This API encrypts a pre-master secret in RSA-2048 mode, using a public key from the input data, for use by the TLS cooperation function.

**Reentrancy**

Not supported.

**4.2.14.3 R\_TSIP\_TlsGenerateMasterSecret****Format**

```
#include "r_tsip_rx_if.h"
e_tsip_err_t R_TSIP_TlsGenerateMasterSecret(
 uint32_t select_cipher_suite,

| server_mac_key_index   | Output | MAC wrapped key for server to client communication                                                                                                                                                                                                                                                                                                                                                                    |
| client_crypt_key_index | Output | AES common wrapped key for client to server communication                                                                                                                                                                                                                                                                                                                                                             |
| server_crypt_key_index | Output | AES common wrapped key for server to client communication                                                                                                                                                                                                                                                                                                                                                             |
| client_iv              | Output | IV used for transmission from client to server<br>Output when the value of select_cipher_suite is 0 to 5. (Used when NetX Duo is employed on the RX651 or RX65N.)<br>Otherwise, nothing is output.                                                                                                                                                                                                                    |
| server_iv              | Output | IV used for reception from server<br>Output when the value of select_cipher_suite is 0 to 5. (Used when NetX Duo is employed on the RX651 or RX65N.)<br>Otherwise, nothing is output.                                                                                                                                                                                                                                 |

**Return Values**

|                             |                                                                                                                                       |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| TSIP_SUCCESS:               | Normal termination                                                                                                                    |
| TSIP_ERR_FAIL:              | Occurrence of internal error                                                                                                          |
| TSIP_ERR_RESOURCE_CONFLICT: | Occurrence of resource conflict because a hardware resource needed by the processing routine was in use by another processing routine |

### Description

This API outputs TLS common keys for use by the TLS cooperation function.

Nothing is output for the client\_iv and server\_iv parameters when the status is other than that specified in the parameter explanation.

Key information used for communication is retained internally by the TSIP.

### Reentrancy

Not supported.

---

#### 4.2.14.5 R\_TSIP\_TlsGenerateVerifyData

---

##### Format

```
#include "r_tsip_rx_if.h"
e_tsip_err_t R_TSIP_TlsGenerateVerifyData(
 uint32_t select_verify_data,
 uint32_t *tsip_master_secret,
 uint8_t *hand_shake_hash,
 uint8_t *verify_data
)
```

##### Parameters

|                    |        |                                                                                                                                                                                   |
|--------------------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| select_verify_data | Input  | Client/server selection<br>R_TSIP_TLS_GENERATE_CLIENT_VERIFY:<br>Client verification data is generated.<br>R_TSIP_TLS_GENERATE_SERVER_VERIFY:<br>Server verify data is generated. |
| tsip_master_secret | Input  | Master secret data on which TSIP-specific<br>conversion has been performed<br>Use the value of tsip_master_secret output by<br>R_TSIP_TlsGenerateMasterSecret.                    |
| hand_shake_hash    | Input  | SHA256 hash value for entire TLS handshake<br>message                                                                                                                             |
| verify_data        | Output | Verification data for Finished message                                                                                                                                            |

##### Return Values

|                             |                                                                                                                                             |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| TSIP_SUCCESS:               | Normal termination                                                                                                                          |
| TSIP_ERR_FAIL:              | Occurrence of internal error                                                                                                                |
| TSIP_ERR_RESOURCE_CONFLICT: | Occurrence of resource conflict because a hardware<br>resource needed by the processing routine was in use<br>by another processing routine |

##### Description

This API generates verification data for use by the TLS cooperation function.

| encrypted_ephemeral_ecdh_public_key | Output | Encrypted ephemeral ECDH public key used by R_TSIP_TlsGeneratePreMasterSecretWithEccP256Key<br>The data size is 24 words (96 bytes) size                                                                                                                       |

**Return Values**

|                             |                                                                                                                                       |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| TSIP_SUCCESS:               | Normal termination                                                                                                                    |
| TSIP_ERR_FAIL:              | Occurrence of internal error                                                                                                          |
| TSIP_ERR_RESOURCE_CONFLICT: | Occurrence of resource conflict because a hardware resource needed by the processing routine was in use by another processing routine |

**Description**

This API verifies a ServerKeyExchange signature, using the input public key data, for use by the TLS cooperation function. If the signature is verified successfully, the ephemeral ECDH public key used by R\_TSIP\_TlsGeneratePreMasterSecretWithEccP256Key is encrypted and output.

Applicable cypher suites: TLS\_ECDHE\_ECDSA\_WITH\_AES\_128\_CBC\_SHA256,  
TLS\_ECDHE\_RSA\_WITH\_AES\_128\_CBC\_SHA256,

TLS\_ECDHE\_ECDSA\_WITH\_AES\_128\_GCM\_SHA256,  
TLS\_ECDHE\_RSA\_WITH\_AES\_128\_GCM\_SHA256

**Reentrancy**

Not supported.

**4.2.14.7 R\_TSIP\_GenerateTlsP256EccKeyIndex****Format**

```
#include "r_tsip_rx_if.h"
e_tsip_err_t R_TSIP_GenerateTlsP256EccKeyIndex(
 tsip_tls_p256_ecc_key_index_t *tls_p256_ecc_key_index,
 uint8_t *ephemeral_ecdh_public_key
)
```

**Parameters**

|                           |        |                                                                                                                                                      |
|---------------------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| tls_p256_ecc_key_index    | Output | Ephemeral ECC secret wrapped key<br>Use this value as the tls_p256_ecc_key_index parameter input to R_TSIP_TlsGeneratePreMasterSecretWithEccP256Key. |
| ephemeral_ecdh_public_key | Output | Ephemeral ECDH public key to be sent to the server<br>Qx (256 bits)    Qy (256 bits)                                                                 |

**Return Values**

|                             |                                                                                                                                       |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| TSIP_SUCCESS:               | Normal termination                                                                                                                    |
| TSIP_ERR_FAIL:              | Occurrence of internal error                                                                                                          |
| TSIP_ERR_RESOURCE_CONFLICT: | Occurrence of resource conflict because a hardware resource needed by the processing routine was in use by another processing routine |

**Description**

This API generates a key pair from a random number for use by the TLS cooperation function for elliptic curve cryptography over a 256-bit prime field.

Applicable cypher suites: TLS\_ECDHE\_ECDSA\_WITH\_AES\_128\_CBC\_SHA256,  
 TLS\_ECDHE\_RSA\_WITH\_AES\_128\_CBC\_SHA256,  
 TLS\_ECDHE\_ECDSA\_WITH\_AES\_128\_GCM\_SHA256,  
 TLS\_ECDHE\_RSA\_WITH\_AES\_128\_GCM\_SHA256

**Reentrancy**

Not supported.

**Return Values**

|                             |                                                                                                                                       |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| TSIP_SUCCESS:               | Normal termination                                                                                                                    |
| TSIP_ERR_FAIL:              | Occurrence of internal error                                                                                                          |
| TSIP_ERR_RESOURCE_CONFLICT: | Occurrence of resource conflict because a hardware resource needed by the processing routine was in use by another processing routine |

**Description**

This API generates encrypted extended master secret data, using encrypted pre-master secret data, for use by the TLS cooperation function.

**Reentrancy**

Not supported.

## 4.2.15 TLS (TLS 1.3)

### 4.2.15.1 R\_TSIP\_GenerateTls13P256EccKeyIndex

#### Format

```
#include "r_tsip_rx_if.h"
e_tsip_err_t R_TSIP_TlsGenerateTls13P256EccKeyIndex(
 tsip_tls13_handle_t *handle,
 e_tsip_tls13_mode_t mode,
 tsip_tls_p256_ecc_key_index_t *key_index,
 uint8_t *ephemeral_ecdh_public_key
)
```

#### Parameters

|                           |        |                                                                                                                                                                |
|---------------------------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| handle                    | Input  | Handle number (work area) indicating same session                                                                                                              |
| mode                      | Input  | Handshake protocol to use<br>TSIP_TLS13_MODE_FULL_HANDSHAKE:<br>Full handshake<br>TSIP_TLS13_MODE_RESUMPTION:<br>Resumption<br>TSIP_TLS13_MODE_0_RTT:<br>0-RTT |
| key_index                 | Output | Ephemeral ECC secret wrapped key<br>Use this value as the key_index parameter input to<br>R_TSIP_Tls13GenerateEcdheSharedSecret.                               |
| ephemeral_ecdh_public_key | Output | Ephemeral ECDH public key to be sent to the server<br>Qx (256 bits)    Qy (256 bits)                                                                           |

#### Return Values

|                             |                                                                                                                                       |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| TSIP_SUCCESS:               | Normal termination                                                                                                                    |
| TSIP_ERR_FAIL:              | Occurrence of internal error                                                                                                          |
| TSIP_ERR_RESOURCE_CONFLICT: | Occurrence of resource conflict because a hardware resource needed by the processing routine was in use by another processing routine |

#### Description

This API generates a key pair from a random number for use by the TLS 1.3 cooperation function for elliptic curve cryptography over a 256-bit prime field.

#### Reentrancy

Not supported.

**4.2.15.2 R\_TSIP\_Tls13GenerateEcdheSharedSecret****Format**

```
#include "r_tsip_rx_if.h"

**Description**

This API calculates a shared secret, which is a shared key over a 256-bit prime field, using a public key provided by the server and a previously calculated secret key, and generates a wrapped key for use by the TLS 1.3 cooperation function.

Applicable cypher suites: TLS\_AES\_128\_GCM\_SHA256, TLS\_AES\_128\_CCM\_SHA256

Key exchange format: ECDHE NIST P-256

**Reentrancy**

Not supported.

---

#### 4.2.15.3 R\_TSIP\_Tls13GenerateHandshakeSecret

---

**Format**

```
#include "r_tsip_rx_if.h"
e_tsip_err_t R_TSIP_Tls13GenerateHandshakeSecret(
 tsip_tls13_ephemeral_shared_secret_key_index_t *shared_secret_key_index,
 tsip_tls13_ephemeral_handshake_secret_key_index_t *handshake_secret_key_index
)
```

**Parameters**

|                            |        |                                                                                                                                                                                                                                                   |
|----------------------------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| shared_secret_key_index    | Input  | Shared secret ephemeral wrapped key<br>Use the value of shared_secret_key_index output by R_TSIP_Tls13GenerateEcdheSharedSecret.                                                                                                                  |

### Description

This API updates, using an application traffic secret, an encryption wrapped key corresponding to an application traffic secret wrapped key for use by the TLS 1.3 cooperation function.

### Reentrancy

Not supported.

**4.2.15.10 R\_TSIP\_Tls13GenerateResumptionMasterSecret****Format**

```
#include "r_tsip_rx_if.h"
e_tsip_err_t R_TSIP_Tls13GenerateResumptionMasterSecret(

### **Description**

This API generates a resumption master secret wrapped key, using a master secret ephemeral key, for use by the TLS 1.3 cooperation function.

As specified in RFC 8446, delete master\_secret\_key\_index, the master secret ephemeral wrapped key, after generating a resumption master secret wrapped key using this API.

### **Reentrancy**

Not supported.

**4.2.15.11 R\_TSIP\_Tls13GeneratePreSharedKey****Format**

```
#include "r_tsip_rx_if.h"

**Description**

This API generates a handshake secret wrapped key, using the pre-shared wrapped key generated by R\_TSIP\_Tls13GeneratePreSharedKey, for use by the TLS 1.3 cooperation function.

Only pre-shared keys generated by the TSIP can be used. Other pre-shared keys are not supported.

**Reentrancy**

Not supported.

**Description**

This API generates a client write wrapped key for use as 0-RTT, using the pre-shared key generated by R\_TSIP\_Tls13GeneratePreSharedKey, for use by the TLS 1.3 cooperation function.

As stated in section 2.3 of RFC 8446, when using 0-RTT the data is not forward secret and there are no guarantees of non-replay between connections. A judgment must be made with these risks in mind as to the use of this functionality.

**Reentrancy**

Not supported.

**4.2.15.15 R\_TSIP\_Tls13CertificateVerifyGenerate****Format**

```
#include "r_tsip_rx_if.h"
e_tsip_err_t R_TSIP_Tls13CertificateVerifyGenerate(
 uint32_t *key_index,
 e_tsip_tls13_signature_scheme_type_t signature_scheme,
 uint8_t *digest,
 uint8_t *certificate_verify,
 uint32_t *certificate_verify_len
)
```

**Parameters**

**Description**

This API verifies a CertificateVerify message received from the server for use by the TLS 1.3 cooperation function. The algorithms used are ecdsa\_secp256r1\_sha256 and rsa\_pss\_rsae\_sha256.

**Reentrancy**

Not supported.

**4.2.15.17 R\_TSIP\_GenerateTls13SVP256EccKeyIndex****Format**

```
#include "r_tsip_rx_if.h"
e_tsip_err_t R_TSIP_TlsGenerateTls13SVP256EccKeyIndex(

**Description**

This API calculates a shared secret, which is a shared key over a 256-bit prime field, using a public key provided by the server and a previously calculated secret key, and generates a wrapped key for use by the server function of the TLS 1.3 cooperation function.

Applicable cypher suites: TLS\_AES\_128\_GCM\_SHA256, TLS\_AES\_128\_CCM\_SHA256

Key exchange format: ECDHE NIST P-256

**Reentrancy**

Not supported.

**Description**

This API generates, using the handshake secret output by R\_TSIP\_Tls13SVGenerateHandshakeSecret, a client write wrapped key and client finished wrapped key for use by the server function of the TLS 1.3 cooperation function.

**Reentrancy**

Not supported.

**4.2.15.22 R\_TSIP\_Tls13SVClientHandshakeVerification****Format**

```
#include "r_tsip_rx_if.h"
e_tsip_err_t R_TSIP_Tls13SVClientHandshakeVerification(
 e_tsip_tls13_mode_t mode,
 tsip_tls13_ephemeral_client_finished_key_index_t *client_finished_key_index,
 uint8_t *digest,
 uint8_t *client_finished
)
```

**Parameters**

|                           |       |                                                                                                                                                                                                                                                                                                                                                                                                                     |

| TSIP_ERR_VERIFICATION_FAIL  | Verification failure                                                                                                                  |

**Description**

This API verifies handshake messages, using the Finished information provided by the client, for use by the server function of the TLS 1.3 cooperation function.

If this API returns a value of TSIP\_ERR\_VERIFICATION\_FAIL, halt TLS communication including the verified handshake messages.

**Reentrancy**

Not supported.

**4.2.15.23 R\_TSIP\_Tls13SVGenerateMasterSecret****Format**

```
#include "r_tsip_rx_if.h"

### Description

This API generates an application traffic secret wrapped key, using a master secret ephemeral key, for use by the server function of the TLS 1.3 cooperation function. It also generates server write key and client write key ephemeral wrapped keys.

When application data is sent from the server without waiting to receive ClientFinished messages and a ClientFinished verification error occurs, the error can only be detected under conditions in which the server program has not been tampered with. A judgment must be made with these risks in mind as to the use of this functionality.

### Reentrancy

Not supported.

### **Description**

This API generates a resumption master secret wrapped key, using a master secret ephemeral key, for use by the server function of the TLS 1.3 cooperation function.

As specified in RFC 8446, delete master\_secret\_key\_index, the master secret ephemeral wrapped key, after generating a resumption master secret wrapped key using this API.

### **Reentrancy**

Not supported.

**Description**

This API generates a handshake secret wrapped key, using the pre-shared wrapped key generated by R\_TSIP\_Tls13GeneratePreSharedKey, for use by the server function of the TLS 1.3 cooperation function.

Only pre-shared keys generated by the TSIP can be used. Other pre-shared keys are not supported.

**Reentrancy**

Not supported.

**Description**

This API generates a client write wrapped key for use as 0-RTT, using the pre-shared key generated by R\_TSIP\_Tls13GeneratePreSharedKey, for use by the server function of the TLS 1.3 cooperation function.

As stated in section 2.3 of RFC 8446, when using 0-RTT the data is not forward secret and there are no guarantees of non-replay between connections. A judgment must be made with these risks in mind as to the use of this functionality.

**Reentrancy**

Not supported.

**4.2.15.31 R\_TSIP\_Tls13SVCertificateVerifyGenerate****Format**

```
#include "r_tsip_rx_if.h"
e_tsip_err_t R_TSIP_Tls13SVCertificateVerifyGenerate(

**Description**

This API generates a CertificateVerify message to be sent to the server for use by the server function of the TLS 1.3 cooperation function. The algorithms used are ecdsa\_secp256r1\_sha256 and rsa\_pss\_rsae\_sha256.

**Reentrancy**

Not supported.

**4.2.15.32 R\_TSIP\_Tls13SVCertificateVerifyVerification****Format**

```
#include "r_tsip_rx_if.h"
e_tsip_err_t R_TSIP_Tls13SVCertificateVerifyVerification(
 uint32_t *key_index,
 e_tsip_tls13_signature_scheme_type_t signature_scheme,
 uint8_t *digest,
 uint8_t *certificate_verify,
 uint32_t certificate_verify_len
)
```

**Parameters**

|                        |       |                                                                                                                                                                                                                                                                                                                                                                                                  |

| TSIP_ERR_RESOURCE_CONFLICT: | Occurrence of resource conflict because a hardware resource needed by the processing routine was in use by another processing routine |
| TSIP_ERR_KEY_SET            | Invalid wrapped key input                                                                                                             |

**Description**

The R\_TSIP\_Tls13EncryptInit() function performs preparations for the encryption of TLS 1.3 communication data and writes the result to the first parameter, handle. The parameter handle is used subsequently as a parameter by the R\_TSIP\_Tls13EncryptUpdate() and R\_TSIP\_Tls13EncryptFinal() functions.

**Reentrancy**

Not supported.

---

**4.2.15.34 R\_TSIP\_Tls13EncryptUpdate**

---

**Format**

```
#include "r_tsip_rx_if.h"
e_tsip_err_t R_TSIP_Tls13EncryptUpdate(
 tsip_tls13_handle_t *handle,
 uint8_t *plain,
 uint8_t *cipher,
 uint32_t plain_length
)
```

**Parameters**

|              |              |                             |
|--------------|--------------|-----------------------------|
| handle       | Input/output | TLS 1.3 handler (work area) |
| plain        | Input        | Plaintext data area         |
| cipher       | Output       | Ciphertext data area        |
| plain_length | Input        | Plaintext data length       |

**Return Values**

|                            |                         |
|----------------------------|-------------------------|
| TSIP_SUCCESS:              | Normal termination      |
| TSIP_ERR_PARAMETER         | Invalid input data      |
| TSIP_ERR_PROHIBIT_FUNCTION | Invalid function called |

**Description**

The R\_TSIP\_Tls13EncryptUpdate() function encrypts the plaintext specified by the second parameter, plain, using the value specified for key\_index in R\_TSIP\_Tls13EncryptInit() function. The function internally buffers the data input by the user until the input value of plain exceeds 16 bytes. Once the input data from plain reaches 16 bytes or more, the encrypted result is output to the area specified by the third parameter, cipher. Specify as the payload\_length parameter of R\_TSIP\_Tls13EncryptInit() function the total data length of the data to be input as plain. For the plain\_length parameter of this function, specify the data length to be input when the user calls the function. If the input value of plain is not divisible by 16 bytes, the function performs padding internally.

Except in cases where the addresses are the same, specify areas for plain and cipher that do not overlap.

**Reentrancy**

Not supported.

---

**4.2.15.35 R\_TSIP\_Tls13EncryptFinal**

---

**Format**

```
#include "r_tsip_rx_if.h"
e_tsip_err_t R_TSIP_Tls13EncryptFinal(
 tsip_tls13_handle_t *handle,
 uint8_t *cipher,
 uint32_t *cipher_length
)
```

**Parameters**

|               |              |                             |
|---------------|--------------|-----------------------------|
| handle        | Input/output | TLS 1.3 handler (work area) |
| cipher        | Output       | Ciphertext data area        |
| cipher_length | Output       | Ciphertext data length      |

**Return Values**

|                            |                              |
|----------------------------|------------------------------|
| TSIP_SUCCESS:              | Normal termination           |
| TSIP_ERR_FAIL              | Occurrence of internal error |
| TSIP_ERR_PARAMETER         | Invalid input data           |
| TSIP_ERR_PROHIBIT_FUNCTION | Invalid function called      |

**Description**

If there is 16-byte fractional remainder data indicated by the data length of the value of plain input to R\_TSIP\_Tls13EncryptUpdate() function, the R\_TSIP\_Tls13EncryptFinal() function outputs the result of encrypting the fractional remainder data to the area specified by the second parameter, cipher. At this time, if the data is less than 16 bytes, it is padded with zeros by the function internally.

**Reentrancy**

Not supported.

**Description**

The R\_TSIP\_Tls13DecryptInit() function performs preparations for the decryption of TLS 1.3 communication data and writes the result to the first parameter, handle. The parameter handle is used subsequently as a parameter by the R\_TSIP\_Tls13DecryptUpdate() and R\_TSIP\_Tls13DecryptFinal() functions.

**Reentrancy**

Not supported.

---

**4.2.15.37 R\_TSIP\_Tls13DecryptUpdate**

---

**Format**

```
#include "r_tsip_rx_if.h"
e_tsip_err_t R_TSIP_Tls13DecryptUpdate(
 tsip_tls13_handle_t *handle,
 uint8_t *cipher,
 uint8_t *plain,
 uint32_t cipher_length
)
```

**Parameters**

|               |              |                             |
|---------------|--------------|-----------------------------|
| handle        | Input/output | TLS 1.3 handler (work area) |
| cipher        | Input        | Ciphertext data area        |
| plain         | Output       | Plaintext data area         |
| cipher_length | Input        | Ciphertext data length      |

**Return Values**

|                            |                         |
|----------------------------|-------------------------|
| TSIP_SUCCESS:              | Normal termination      |
| TSIP_ERR_PARAMETER         | Invalid input data      |
| TSIP_ERR_PROHIBIT_FUNCTION | Invalid function called |

**Description**

The R\_TSIP\_Tls13DecryptUpdate() function decrypts the ciphertext specified by the second parameter, cipher, using the value specified for key\_index in R\_TSIP\_Tls13DecryptInit() function. The function internally buffers the data input by the user until the input value of cipher exceeds 16 bytes. Once the input data from cipher reaches 16 bytes or more, the decrypted result is output to the area specified by the third parameter, plain. Specify as the payload\_length parameter of R\_TSIP\_Tls13DecryptInit() function the total data length of the data to be input as cipher. For the cipher\_length parameter of this function, specify the data length to be input when the user calls the function. If the input value of cipher is not divisible by 16 bytes, the function performs padding internally.

Except in cases where the addresses are the same, specify areas for plain and cipher that do not overlap.

**Reentrancy**

Not supported.

---

**4.2.15.38 R\_TSIP\_Tls13DecryptFinal**

---

**Format**

```
#include "r_tsip_rx_if.h"
e_tsip_err_t R_TSIP_Tls13DecryptFinal(
 tsip_tls13_handle_t *handle,
 uint8_t *plain,
 uint32_t *plain_length
)
```

**Parameters**

|              |              |                             |
|--------------|--------------|-----------------------------|
| handle       | Input/output | TLS 1.3 handler (work area) |
| plain        | Output       | Plaintext data area         |
| plain_length | Output       | Plaintext data length       |

**Return Values**

|                            |                              |
|----------------------------|------------------------------|
| TSIP_SUCCESS:              | Normal termination           |
| TSIP_ERR_FAIL              | Occurrence of internal error |
| TSIP_ERR_PARAMETER         | Invalid input data           |
| TSIP_ERR_PROHIBIT_FUNCTION | Invalid function called      |

**Description**

If the data length of cipher input in R\_TSIP\_Tls13DecryptUpdate() function results in a fractional remainder after 16 bytes, the R\_TSIP\_Tls13DecryptFinal() function outputs the leftover decrypted data to the second parameter, plain. At this time, if the data is less than 16 bytes, it is padded with zeros by the function internally. For plain, specify a RAM address that is a multiple of 4.

**Reentrancy**

Not supported.

## 4.2.16 Firmware Update

---

### 4.2.16.1 R\_TSIP\_StartUpdateFirmware

---

#### Format

e\_tsip\_err\_t R\_TSIP\_StartUpdateFirmware(void)

#### Parameters

None

#### Return Values

TSIP\_SUCCESS:

Normal termination

TSIP\_ERR\_RESOURCE\_CONFLICT:

Occurrence of resource conflict because a hardware resource needed by the processing routine was in use by another processing routine

#### Description

Transitions to the firmware update state.

#### Reentrancy

Not supported.

| TSIP_RESUME_FIRMWARE_GENERATE_MAC | There is additional processing. It is necessary to call the API again.                                                                |

**Description**

This function accepts encrypted firmware data and a firmware checksum value, decrypts the firmware, and generates a new MAC value. The user can update the firmware by writing the decrypted firmware and new MAC value to the flash ROM. Refer to section 3.14, Firmware Update, for details of the firmware update functionality.

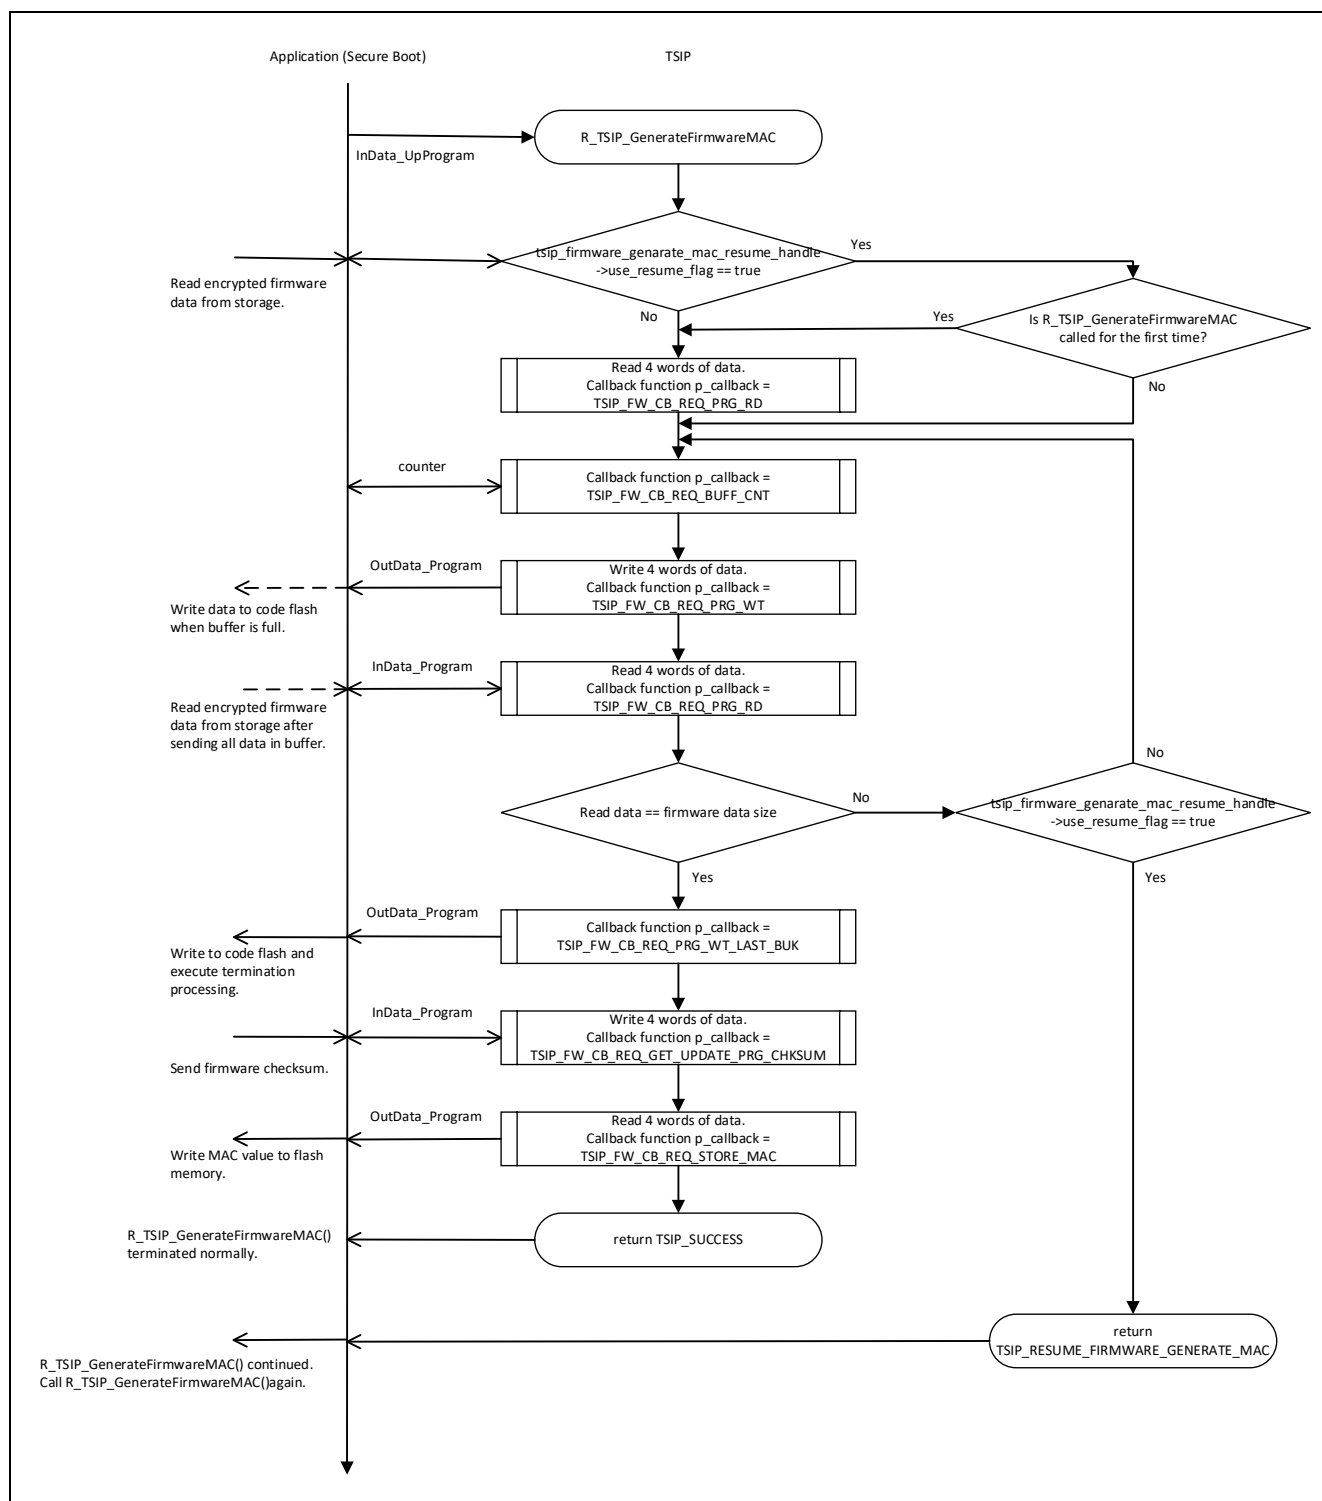

Figure 4.1 Flowchart of Calls to Callback Function

Processing to read and write firmware data is performed in 4-word units. The following steps are used to call the callback function registered as the seventh parameter, `p_callback`. The string in parentheses () is the type of processing specified by the first parameter, `req_type`, of the callback function `p_callback`.

1. Increment adjustment (`TSIP_FW_CB_REQ_BUFF_CNT`)
2. Writing of decrypted firmware to storage destination (`TSIP_FW_CB_REQ_PRG_WT`)
3. Storage of encrypted firmware in `InData_UpProgram` (`TSIP_FW_CB_REQ_PRG_RD`)

It is not necessary to perform the processing in the callback function every time. Perform processing as appropriate for the sizes reserved for InData\_Program and OutData\_Program.

For example, if a 512-word buffer has been reserved, adjust the increment to match the buffer position on the  $512 / 4 = 128$ th time (TSIP\_FW\_CB\_REQ\_BUFF\_CNT), write to the storage destination (TSIP\_FW\_CB\_REQ\_PRG\_WT), and store the encrypted firmware in InData\_UpProgram (TSIP\_FW\_CB\_REQ\_PRG\_RD).

As the write request to the final storage destination, specify req\_type = TSIP\_FW\_CB\_REQ\_PRG\_WT\_LAST\_BLK (not TSIP\_FW\_CB\_REQ\_PRG\_WT).

This API is called again by the callback function p\_callback after reading and writing all of the firmware data has completed. After confirming that the value of the first parameter, req\_type, of the callback function p\_callback is TSIP\_FW\_CB\_REQ\_GET\_UPDATE\_PRG\_CHKSUM, pass the checksum value to the fourth parameter, InData\_UpProgram, of p\_callback. This API generates a firmware MAC value after reading and verifying the checksum value. After this, the MAC value is passed to the user using the fifth parameter, OutData\_Program, when the first parameter, req\_type, of callback function p\_callback is TSIP\_FW\_CB\_REQ\_STORE\_MAC. Store the MAC value in the flash memory area.

If called when tsip\_firmware\_generate\_mac\_resume\_handle->use\_resume\_flag is set to true, this API operates as a firmware update start and update function but does not perform the firmware update processing in its entirety. If there is additional processing remaining, a value of TSIP\_RESUME\_FIRMWARE\_GENERATE\_MAC is returned. Continue to call R\_TSIP\_GenerateFirmwareMAC() until a value of TSIP\_SUCCESS is returned. A return value of TSIP\_SUCCESS indicates that firmware update processing has completed successfully.

### **Reentrancy**

Not supported.

---

#### 4.2.16.3 R\_TSIP\_VerifyFirmwareMAC

---

##### Format

```
#include "r_tsip_rx_if.h"
e_tsip_err_t R_TSIP_VerifyFirmwareMAC(
 uint32_t *InData_Program,
 uint32_t MAX_CNT,
 uint32_t *InData_MAC
)
```

##### Parameters

|                |       |                                                                                                                                                                                                                                                                         |

##### Description

This function accepts firmware data and a MAC value, and verifies the MAC value. As the third parameter, InData\_Mac, pass the MAC value generated by R\_TSIP\_GenerateFirmwareMAC().

AES-CMAC is used as the MAC verification algorithm.

##### Reentrancy

Not supported.

**4.2.16.4 TSIP\_GEN\_MAC\_CB\_FUNC\_T Type****Format**

```
#include "r_tsip_rx_if.h"
typedef void (*TSIP_GEN_MAC_CB_FUNC_T)(
 TSIP_FW_CB_REQ_TYPE req_type,
 uint32_t iLoop,
 uint32_t *counter,
 uint32_t *InData_UpProgram,
 uint32_t *OutData_Program,
 uint32_t MAX_CNT)
```

**Parameters**

| MAX_CNT          | Input        | Same value as sixth parameter, MAX_CNT, of<br>R_TSIP_GenerateFirmwareMAC()               |

**Return Values**

None

**Description**

This function is used by the R\_TSIP\_GenerateFirmwareMAC function and is registered as its seventh parameter.

The function is used to store the decrypted firmware and MAC on the user side.

The size of the InData\_UpProgram and OutData\_Program areas must be a multiple of 4 and no fewer than 4 words. InData\_UpProgram and OutData\_Program should be the same size. The demo project uses the block size of code flash write unit.

This callback function is called by the R\_TSIP\_GenerateFirmwareMAC function for multiple types of requests. The type of request is stored in the first parameter, req\_type.

The first parameter, req\_type, has the value defined by the enum TSIP\_FW\_CB\_REQ\_TYPE.

```
typedef enum
{
 TSIP_FW_CB_REQ_PRG_WT = 0u,
 TSIP_FW_CB_REQ_PRG_RD,
 TSIP_FW_CB_REQ_BUFF_CNT,
 TSIP_FW_CB_REQ_PRG_WT_LAST_BLK,
 TSIP_FW_CB_REQ_GET_UPDATE_PRG_CHKSUM,
 TSIP_FW_CB_REQ_STORE_MAC,
}TSIP_FW_CB_REQ_TYPE;
```

Based on this value, the user takes the necessary actions.

<req\_type = TSIP\_FW\_CB\_REQ\_PRG\_WT>

This is a request to store decrypted firmware.

The TSIP module issues this request each time after storing data in the fifth parameter, OutData\_Program, in 4-word units. It is not necessary to process every request. Store the decrypted firmware as appropriate in the areas secured on the user side. For example, if 8-word areas have been secured, store the decrypted firmware once every two requests.

The total decrypted data size is stored in the second parameter, iLoop. The maximum value of iLoop in this request is the value of the sixth parameter, MAX\_CNT, minus 4 words. The last 4 words and the unstored firmware are handled by the request <req\_type = TSIP\_FW\_CB\_REQ\_PRG\_WT\_LAST\_BLK>.

<req\_type = TSIP\_FW\_CB\_REQ\_PRG\_RD>

This is a request to obtain encrypted firmware to be applied as an update.

The TSIP module issues this request each time before performing decryption in 4-word units. It works in the same manner as <req\_type = TSIP\_FW\_CB\_REQ\_PRG\_WT>. Store the decrypted firmware, as appropriate for the areas secured on the user side, in the fourth parameter, InData\_UpProgram.

<req\_type = TSIP\_FW\_CB\_REQ\_BUFF\_CNT>

This is a request for the offset value used when referencing the fourth parameter, InData\_UpProgram, and the fifth parameter, OutData\_Program. Return a value in 4-word increments to the third parameter, counter. If the size secured by the fourth parameter, InData\_UpProgram, and the fifth parameter, OutData\_Program, is exceeded, restore the third parameter, counter, to its default value.

<req\_type = TSIP\_FW\_CB\_REQ\_PRG\_WT\_LAST\_BLK>

This is a request that is issued when the last block of the encrypted firmware is decrypted. Store the areas that cannot be stored by the decrypted firmware at this time.

<req\_type = TSIP\_FW\_CB\_REQ\_GET\_UPDATE\_PRG\_CHKSUM>

This is a request to obtain the firmware checksum value for the firmware to be applied as an update.

Store the checksum value in the fourth parameter, InData\_UpProgram. The checksum size is 16 bytes.

<req\_type = req\_type = TSIP\_FW\_CB\_REQ\_STORE\_MAC>

This is a request to output the MAC for the decrypted firmware.

The MAC is stored in the fifth parameter, OutData\_Program. The MAC size is 16 bytes.

The value of the sixth parameter, MAX\_CNT, is the same as that of the sixth parameter of R\_TSIP\_GenerateFirmwareMAC(), MAX\_CNT.

## 5. Appendix

### 5.1 Confirmed Operation Environment

The operation of the driver has been confirmed in the following environment.

**Table 5-1 Confirmed Operation Environment**

| Item                               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## 5.2 Troubleshooting

(1) Q: I added the FIT module to my project, but when I build it I get the error "Could not open source file 'platform.h'."

A: The FIT module may not have been added to the project properly. Refer to the documents listed below to confirm the method for adding FIT modules:

- Using CS+  
Application Note: Adding Firmware Integration Technology Modules to CS+ Projects (R01AN1826)
- Using e<sup>2</sup> studio  
Application Note: Adding Firmware Integration Technology Modules to Projects (R01AN1723)

When using the FIT module, the board support package FIT module (BSP module) must also be added to the project. Refer to the application note "RX Family: Board Support Package Module Using Firmware Integration Technology" (R01AN1685) for instructions for adding the BSP module.

(2) Q: I want to use the FIT Demos e<sup>2</sup> studio sample project on CS+.

A: Visit the following webpage for instructions:

Porting from the e<sup>2</sup> studio to CS+

> Convert an Existing Project to Create a New Project With CS+

<https://www.renesas.com/jp/ja/products/software-tools/tools/migration-tools/migration-e2studio-to-csplus.html>

Note: In step 5, the [Q0268002] dialog box may appear if the box next to "Backup the project composition files after conversion" is checked. If you click the **Yes** button in the [Q0268002] dialog box, you must then re-input the compiler include path.

### 5.3 User Key Encryption Formats

For key injection the user key is wrapped using a UFPK and IV, and for key updating the user key is wrapped using a KUK and IV. The format of the key data to be wrapped depends on the cryptographic algorithm. This section lists the data formats for the user key to be encrypted (user key) and for the wrapped key (encrypted user key).

Refer to 3.7.1, Key Injection and Updating, for information on encryption methods.

#### 5.3.1 AES

##### 5.3.1.1 AES 128-Bit Key

Input (User key)

|       |                 |   |   |   |
|-------|-----------------|---|---|---|
| Bytes | 16              |   |   |   |
|       | 4               | 4 | 4 | 4 |
| 0-15  | 128-bit AES key |   |   |   |

Output (Encrypted key)

|       |                                         |   |   |   |
|-------|-----------------------------------------|---|---|---|
| Bytes | 16                                      |   |   |   |
|       | 4                                       | 4 | 4 | 4 |
| 0-15  | encrypted_user_key<br>(128-bit AES key) |   |   |   |
| 16-31 | MAC                                     |   |   |   |

##### 5.3.1.2 AES 256-Bit Key

Input (User key)

|       |                 |   |   |   |
|-------|-----------------|---|---|---|
| Bytes | 16              |   |   |   |
|       | 4               | 4 | 4 | 4 |
| 0-31  | 256-bit AES key |   |   |   |

Output (Encrypted key)

|       |                                         |   |   |   |
|-------|-----------------------------------------|---|---|---|
| Bytes | 16                                      |   |   |   |
|       | 4                                       | 4 | 4 | 4 |
| 0-31  | encrypted_user_key<br>(256-bit AES key) |   |   |   |
| 32-47 | MAC                                     |   |   |   |

#### 5.3.2 DES

Input (User key)

|       |                                    |   |   |   |
|-------|------------------------------------|---|---|---|
| Bytes | 16                                 |   |   |   |
|       | 4                                  | 4 | 4 | 4 |
| 0-7   | 56-bit DES key with odd parity 1*1 |   |   |   |
| 8-15  | 56-bit DES key with odd parity 2*1 |   |   |   |
| 16-23 | 56-bit DES key with odd parity 3*1 |   |   |   |

Output (Encrypted key)

|       |                                                                                                                                        |   |   |   |
|-------|----------------------------------------------------------------------------------------------------------------------------------------|---|---|---|
| Bytes | 16                                                                                                                                     |   |   |   |
|       | 4                                                                                                                                      | 4 | 4 | 4 |
| 0-23  | encrypted_user_key<br>(56-bit DES key with odd parity 1   <br>56-bit DES key with odd parity 2   <br>56-bit DES key with odd parity 3) |   |   |   |
| 24-39 | MAC                                                                                                                                    |   |   |   |

Note: 1. Append an odd-parity bit to each 7 bits of key data.

Example: DES key data = 0x0000000000000000 → 0x0101010101010101

DES key data = 0xFFFFFFFFFFFFFFFF → 0xFEFEFEFEFEFEFEFEFE

For 2-DES, insert the same key in the 56-bit DES key with odd parity 1 and the 56-bit DES key with odd parity 3.

For DES, insert the same value in the 56-bit DES key with odd parity 1, the 56-bit DES key with odd parity 2, and the 56-bit DES key with odd parity 3.

**5.3.3 ARC4**

Input (User key)

|       |      |   |   |   |
|-------|------|---|---|---|
| Bytes | 16   |   |   |   |
|       | 4    | 4 | 4 | 4 |
| 0-255 | ARC4 |   |   |   |

Output (Encrypted key)

|         |                           |   |   |   |
|---------|---------------------------|---|---|---|
| Bytes   | 16                        |   |   |   |
|         | 4                         | 4 | 4 | 4 |
| 0-255   | encrypted_user_key (ARC4) |   |   |   |
| 256-272 | MAC                       |   |   |   |

**5.3.4 RSA****5.3.4.1 RSA 1024-Bit Key****(1) Public Key**

Input (User key)

|         |                           |           |   |   |
|---------|---------------------------|-----------|---|---|
| Bytes   | 16                        |           |   |   |
|         | 4                         | 4         | 4 | 4 |
| 0-127   | RSA 1024-bit public key n |           |   |   |
| 128-143 | RSA 1024-bit public key e | 0 padding |   |   |

Output (Encrypted key)

|         |                                                                        |   |   |   |
|---------|------------------------------------------------------------------------|---|---|---|
| Bytes   | 16                                                                     |   |   |   |
|         | 4                                                                      | 4 | 4 | 4 |
| 0-143   | encrypted_user_key<br>(RSA 1024-bit public key n    e   <br>0 padding) |   |   |   |
| 144-159 | MAC                                                                    |   |   |   |

**(2) Secret Key**

Input (User key)

|         |                           |   |   |   |
|---------|---------------------------|---|---|---|
| Bytes   | 16                        |   |   |   |
|         | 4                         | 4 | 4 | 4 |
| 0-127   | RSA 1024-bit public key n |   |   |   |
| 128-255 | RSA 1024-bit secret key d |   |   |   |

Output (Encrypted key)

|         |                                                                      |   |   |   |
|---------|----------------------------------------------------------------------|---|---|---|
| Bytes   | 16                                                                   |   |   |   |
|         | 4                                                                    | 4 | 4 | 4 |
| 0-255   | encrypted_user_key<br>(RSA 1024-bit public key n    secret<br>key d) |   |   |   |
| 256-271 | MAC                                                                  |   |   |   |

**5.3.4.2 RSA 2048-Bit Key****(1) Public Key**

Input (User key)

|         |                           |           |   |   |
|---------|---------------------------|-----------|---|---|
| Bytes   | 16                        |           |   |   |
|         | 4                         | 4         | 4 | 4 |
| 0-255   | RSA 2048-bit public key n |           |   |   |
| 256-271 | RSA 2048-bit public key e | 0 padding |   |   |

Output (Encrypted key)

|         |                                                                        |   |   |   |
|---------|------------------------------------------------------------------------|---|---|---|
| Bytes   | 16                                                                     |   |   |   |
|         | 4                                                                      | 4 | 4 | 4 |
| 0-271   | encrypted_user_key<br>(RSA 2048-bit public key n    e   <br>0 padding) |   |   |   |
| 272-287 | MAC                                                                    |   |   |   |

**(2) Secret Key**

Input (User key)

|         |                           |   |   |   |
|---------|---------------------------|---|---|---|
| Bytes   | 16                        |   |   |   |
|         | 4                         | 4 | 4 | 4 |
| 0-255   | RSA 2048-bit public key n |   |   |   |
| 256-511 | RSA 2048-bit secret key d |   |   |   |

Output (Encrypted key)

|         |                                                                      |   |   |   |
|---------|----------------------------------------------------------------------|---|---|---|
| Bytes   | 16                                                                   |   |   |   |
|         | 4                                                                    | 4 | 4 | 4 |
| 0-511   | encrypted_user_key<br>(RSA 2048-bit public key n    secret<br>key d) |   |   |   |
| 512-527 | MAC                                                                  |   |   |   |

**5.3.4.3 RSA 3072-Bit Key****(1) Public Key**

Input (User key)

|         |                           |           |   |   |
|---------|---------------------------|-----------|---|---|
| Bytes   | 16                        |           |   |   |

## 5.4 Public Key Index Formats for Asymmetric Cryptography

Public keys for asymmetric cryptography contain plaintext information in the key index. This enables plaintext information to be extracted from the key index using the TSIP's key generation functionality. The data format of each cryptographic algorithm is described below.

### 5.4.1 RSA

The key index structure `tsip_rsaXXXX_public_key_index_t` of the RSA public key contains the plaintext data of the public key in members `value.key_n` and `value_e`.

The modulus and exponent values are output in big-endian byte ordering as `key_n` and `key_e`, respectively.

### 5.4.2 ECC

The member `value.key_q` of the key index structure `tsip_ecc_public_key_index_t` of the ECC public key contains the plaintext data of the public key. The format of `key_q` is as shown below.

#### 5.4.2.1 ECC P 192-Bit Key

|       |                                            |         |                         |         |
|-------|--------------------------------------------|---------|-------------------------|---------|
| Bytes | 128 bits                                   |         |                         |         |
|       | 32 bits                                    | 32 bits | 32 bits                 | 32 bits |
| 0-15  | 0 padding                                  |         | ECC P-192 public key Qx |         |
| 16-31 | ECC P 192-bit public key Qx (continuation) |         |                         |         |
| 32-47 | 0 padding                                  |         | ECC P-192 public key Qy |         |
| 48-63 | ECC P 192-bit public key Qy (continuation) |         |                         |         |
| 64-79 | Key index management information           |         |                         |         |

#### 5.4.2.2 ECC P 224-Bit Key

|       |                                            |                         |         |         |
|-------|--------------------------------------------|-------------------------|---------|---------|
| Bytes | 128 bits                                   |                         |         |         |
|       | 32 bits                                    | 32 bits                 | 32 bits | 32 bits |
| 0-15  | 0 padding                                  | ECC P-224 public key Qx |         |         |
| 16-31 | ECC P 224-bit public key Qx (continuation) |                         |         |         |
| 32-47 | 0 padding                                  | ECC P-224 public key Qy |         |         |
| 48-63 | ECC P 224-bit public key Qy (continuation) |                         |         |         |
| 64-79 | Key index management information           |                         |         |         |

#### 5.4.2.3 ECC P 256-Bit Key

|       |                                  |         |         |         |
|-------|----------------------------------|---------|---------|---------|
| Bytes | 128 bits                         |         |         |         |
|       | 32 bits                          | 32 bits | 32 bits | 32 bits |
| 0-31  | ECC P-256-bit public key Qx      |         |         |         |
| 32-63 | ECC P 256-bit public key Qy      |         |         |         |
| 64-79 | Key index management information |         |         |         |

#### 5.4.2.4 ECC P 384-Bit Key

|        |                                  |         |         |         |
|--------|----------------------------------|---------|---------|---------|
| Bytes  | 128 bits                         |         |         |         |
|        | 32 bits                          | 32 bits | 32 bits | 32 bits |
| 0-47   | ECC P 384-bit public key Qx      |         |         |         |

## 5.5 Using Renesas Secure Flash Programmer

### 5.5.1 Usage Notes

Renesas Secure Flash Programmer is a tool included with RX TSIP FIT that can generate Encrypted Keys and encrypted user programs (Note). When using Renesas Secure Flash Programmer, please read the following table as a replacement.

Note : Development of Renesas Secure Flash Programmer was completed with V.1.19.

**Table 5-2 Terminology table Security Key Management Tool and Renesas Secure Flash Programmer**

| Security Key Management Tool                 | Renesas Secure Flash Programmer |
|----------------------------------------------|---------------------------------|
| UFPK(User Factory Programming Key)           | Provisioning Key                |
| W-UFPK(Wrapped User Factory Programming Key) | Encrypted Provisioning Key      |
| KUK(Key Update Key)                          | Update Key Ring                 |
| Encrypted Key                                | Encrypted Key                   |
| Wrapped Key                                  | Key Index                       |
| Key Encryption Key                           | Prog User Key, User Program Key |

### 5.5.2 provisioning key Tab

Figure 5.1 shows the provisioning key tab of Renesas Secure Flash Programmer. The provisioning key tab is used to create a provisioning key file to be sent to the DLM server.

Enter a provisioning key value in hexadecimal 32-byte format for **provisioning key Value** and click the **format to DLM server file...** button.

It is possible to generate a provisioning key file from a random number by pressing the **format to DLM server file...** button when **(Random)** is displayed, but the result cannot be used in actual products because the random number used lacks sufficient precision.

**Figure 5.1 provisioning key Tab of Renesas Secure Flash Programmer**

### 5.5.3 Key Wrap Tab

Figure 5.2 shows the Key Wrap tab of Renesas Secure Flash Programmer. Table 5-3 contains descriptions of the setting values that can be configured on the Key Wrap tab. Based on the descriptions in Table 5-3, enter appropriate setting values and click the **Generate Key Files...** button to generate encrypted key files (key\_data.c and key\_data.h). Refer to Table 5-4 for descriptions of the buttons.

| Key Data                             | User key<br>Refer to 5.5.3.1, Key Data Input Formats, for the key data formats that can be entered.                                                                                                                                                                                                                                                                           | Enter the user key data to be generated.                                                                                                                                                                                       |
| provisioning key File Path           | File path of provisioning key file                                                                                                                                                                                                                                                                                                                                            | Specify the file path of the plaintext provisioning key file to be used when encrypting the user key. Refer to 5.5.2, provisioning key Tab, for instructions for generating a provisioning key file.                           |
| encrypted provisioning key File Path | File path of wrapped provisioning key file                                                                                                                                                                                                                                                                                                                                    | Specify the file path to which the wrapped C language provisioning key file will be output. Refer to 5.5.2, provisioning key Tab, for instructions for generating a wrapped provisioning key file.                             |
| IV (16 byte hex / 32 characters)     | IV value                                                                                                                                                                                                                                                                                                                                                                      | Enter a 16-byte IV value. If the <b>Generate Key File...</b> button is pressed with the input value left as <b>(Random)</b> , a random number generated internally by Renesas Secure Flash Programmer is used as the IV value. |
| Generate Key Files...                | Button for generating C language files                                                                                                                                                                                                                                                                                                                                        | Outputs C language encrypted key files.                                                                                                                                                                                        |

**Table 5-4 Description of Key Wrap Tab Buttons**

| Button                | Description                                                                                                                                                                                                                                                                            |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Register              | Registers the user key data specified in the <b>Key Data</b> field. For <b>Key Data</b> , enter user key data that matches <b>Key Type</b> , then click this button to register it.                                                                                                    |
| Delete                | Deletes the registered user key data. Make sure the entry field containing the user key data is selected, then click this button to delete it.                                                                                                                                         |
| Browse...             | Click these buttons to specify the file paths of the provisioning key file and wrapped provisioning key file, respectively, from the File Explorer interface. You can also enter file paths directly.                                                                                  |
| Generate Key Files... | Generates encrypted key files (key_data.c and key_data.h). Enter appropriate values into the various fields, then click this button. When the button is clicked, a window appears for specifying the folder to which the encrypted key files will be output, and the files are output. |

### 5.5.3.1 Key Data Input Formats

Enter the following data in big-endian order in the **Key Data** field of the Key Wrap tab.

(1) AES 128-bit data format

|       |                  |
|-------|------------------|
| Bytes | 128 bits         |
| 0-15  | AES 128 key data |

(2) AES 256-bit data format

|       |                  |
|-------|------------------|
| Bytes | 256 bits         |
| 0-31  | AES 256 key data |

(3) TDES data format

|       |                |                |                |
|-------|----------------|----------------|----------------|
| Bytes | DES user key 1 | DES user key 2 | DES user key 3 |
| 0-23  | DES key data   | DES key data   | DES key data   |

(4) 2Key-TDES data format

|       |                |                |
|-------|----------------|----------------|
| Bytes | DES user key 1 | DES user key 2 |
| 0-15  | DES key data   | DES key data   |

(5) DES data format

|       |                |
|-------|----------------|
| Bytes | DES user key 1 |
| 0-7   | DES key data   |

The DES key data is 8 bits long and consists of 7 bits of key data and 1 odd parity bit.

DES key data format is shown below.

| DES user key n |          |            |          |            |     |          |            |
|----------------|----------|------------|----------|------------|-----|----------|------------|
| Byte No.       | 0        |            | 1        |            | ... | 8        |            |
| Bits           | 7-1      | 0          | 7-1      | 0          | ... | 7-1      | 0          |
| Data           | Key data | Odd parity | Key data | Odd parity | ... | Key data | Odd parity |

Example: When the parity bit is added, the DES user key 0x00000000000000 becomes  
0x0101010101010101, 0xFFFFFFFFFFFFFFFF becomes 0xFEFEFEFEFEFEFEFE,  
0x01020304050607 becomes 0x018080614029190E.

(6) ARC4 data format

|       |               |
|-------|---------------|
| Bytes | 2048 bits     |
| 0-255 | ARC4 key data |

## (7) SHA1-HMAC data format

|       |                    |
|-------|--------------------|
| Bytes | 160 bits           |
| 0-19  | SHA1-HMAC key data |

## (8) SHA256-HMAC data format

|       |                      |
|-------|----------------------|
| Bytes | 256 bits             |
| 0-31  | SHA256-HMAC key data |

## (9) RSA 1024-bit public data format (132 bytes)

|       |                             |                            |
|-------|-----------------------------|----------------------------|
| Bytes | RSA 1024-bit modulus n      | RSA 1024-bit exponent e    |
| 0-131 | 128-byte RSA modulus n data | 4-byte RSA exponent e data |

Note: Public key

## (10) RSA 1024-bit private data format (256 bytes)

|       |                             |                                         |
|-------|-----------------------------|-----------------------------------------|
| Bytes | RSA 1024-bit modulus n      | RSA 1024-bit decryption exponent d      |
| 0-255 | 128-byte RSA modulus n data | 128-byte RSA decryption exponent d data |

## (11) RSA 1024-bit all data format (260 bytes)

|       |                             |                            |                                         |
|-------|-----------------------------|----------------------------|-----------------------------------------|
| Bytes | RSA 1024-bit modulus n      | RSA 1024-bit exponent e    | RSA 1024-bit decryption exponent d      |
| 0-259 | 128-byte RSA modulus n data | 4-byte RSA exponent e data | 128-byte RSA decryption exponent d data |

## (12) RSA 2048-bit public data format (260 bytes)

|       |                             |                            |
|-------|-----------------------------|----------------------------|
| Bytes | RSA 2048-bit modulus n      | RSA 2048-bit exponent e    |
| 0-259 | 256-byte RSA modulus n data | 4-byte RSA exponent e data |

## (13) RSA 2048-bit private data format (512 bytes)

|       |                             |                                         |
|-------|-----------------------------|-----------------------------------------|
| Bytes | RSA 2048-bit modulus n      | RSA 2048-bit decryption exponent d      |
| 0-511 | 256-byte RSA modulus n data | 256-byte RSA decryption exponent d data |

## (14) RSA 2048-bit all data format (516 bytes)

|       |                             |                            |                                         |
|-------|-----------------------------|----------------------------|-----------------------------------------|
| Bytes | RSA 2048-bit modulus n      | RSA 2048-bit exponent e    | RSA 2048-bit decryption exponent d      |
| 0-515 | 256-byte RSA modulus n data | 4-byte RSA exponent e data | 256-byte RSA decryption exponent d data |

## (15) RSA 3072-bit public data format (388 bytes)

|       |                             |                            |
|-------|-----------------------------|----------------------------|
| Bytes | RSA 3072-bit modulus n      | RSA 3072-bit exponent e    |
| 0-387 | 384-byte RSA modulus n data | 4-byte RSA exponent e data |

## (16) RSA 4096-bit public data format (516 bytes)

|       |                             |                            |
|-------|-----------------------------|----------------------------|
| Bytes | RSA 4096-bit modulus n      | RSA 4096-bit exponent e    |
| 0-515 | 512-byte RSA modulus n data | 4-byte RSA exponent e data |

## (17) ECC 192-bit public data format (48 bytes)

|       |                                |                                |
|-------|--------------------------------|--------------------------------|
| Bytes | ECC 192-bit public key Qx      | ECC 192-bit public key Qy      |
| 0-47  | 24-byte ECC public key Qx data | 24-byte ECC public key Qy data |

## (18) ECC 192-bit private data format (24 bytes)

|       |                             |
|-------|-----------------------------|
| Bytes | ECC 192-bit private key     |
| 0-23  | 24-byte ECC secret key data |

## (19) ECC 192-bit all data format (72 bytes)

| Bytes | ECC 192-bit public key Qx      | ECC 192-bit public key Qy      | ECC 192-bit private key     |
|-------|--------------------------------|--------------------------------|-----------------------------|
| 0-71  | 24-byte ECC public key Qx data | 24-byte ECC public key Qy data | 24-byte ECC secret key data |

## (20) ECC 224-bit public data format (56 bytes)

| Bytes | ECC 224-bit public key Qx      | ECC 224-bit public key Qy      |
|-------|--------------------------------|--------------------------------|
| 0-55  | 28-byte ECC public key Qx data | 28-byte ECC public key Qy data |

## (21) ECC 224-bit private data format (28 bytes)

| Bytes | ECC 224-bit private key     |
|-------|-----------------------------|
| 0-27  | 28-byte ECC secret key data |

## (22) ECC 224-bit all data format (84 bytes)

| Bytes | ECC 224-bit public key Qx      | ECC 224-bit public key Qy      | ECC 224-bit private key     |
|-------|--------------------------------|--------------------------------|-----------------------------|
| 0-83  | 28-byte ECC public key Qx data | 28-byte ECC public key Qy data | 28-byte ECC secret key data |

## (23) ECC 256-bit public data format (64 bytes)

| Bytes | ECC 256-bit public key Qx      | ECC 256-bit public key Qy      |
|-------|--------------------------------|--------------------------------|
| 0-63  | 32-byte ECC public key Qx data | 32-byte ECC public key Qy data |

## (24) ECC 256-bit private data format (32 bytes)

| Bytes | ECC 256-bit private key     |
|-------|-----------------------------|
| 0-31  | 32-byte ECC secret key data |

## (25) ECC 256-bit all data format (96 bytes)

| Bytes | ECC 256-bit public key Qx      | ECC 256-bit public key Qy      | ECC 256-bit private key     |
|-------|--------------------------------|--------------------------------|-----------------------------|
| 0-95  | 32-byte ECC public key Qx data | 32-byte ECC public key Qy data | 32-byte ECC secret key data |

## (26) ECC 384-bit public data format (96 bytes)

| Bytes | ECC 384-bit public key Qx      | ECC 384-bit public key Qy      |
|-------|--------------------------------|--------------------------------|
| 0-95  | 48-byte ECC public key Qx data | 48-byte ECC public key Qy data |

## (27) ECC 384-bit private data format (48 bytes)

| Bytes | ECC 384-bit private key     |
|-------|-----------------------------|
| 0-47  | 48-byte ECC secret key data |

## (28) ECC 384-bit all data format (144 bytes)

| Bytes | ECC 384-bit public key Qx      | ECC 384-bit public key Qy      | ECC 384-bit private key     |
|-------|--------------------------------|--------------------------------|-----------------------------|
| 0-143 | 48-byte ECC public key Qx data | 48-byte ECC public key Qy data | 48-byte ECC secret key data |

| 1.20 | Feb. 28, 2024 | —           | Applied software workaround to avoid the HW issue of AES-CCM decryption (TSIP-Lite)                                                                                                                                                                                                                                 |

# General Precautions in the Handling of Microprocessing Unit and Microcontroller Unit Products

The following usage notes are applicable to all Microprocessing unit and Microcontroller unit products from Renesas. For detailed usage notes on the products covered by this document, refer to the relevant sections of the document as well as any technical updates that have been issued for the products.

## 1. Precaution against Electrostatic Discharge (ESD)

A strong electrical field, when exposed to a CMOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop the generation of static electricity as much as possible, and quickly dissipate it when it occurs. Environmental control must be adequate. When it is dry, a humidifier should be used. This is recommended to avoid using insulators that can easily build up static electricity.

Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work benches and floors must be grounded. The operator must also be grounded using a wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions must be taken for printed circuit boards with mounted semiconductor devices.

## 2. Processing at power-on

The state of the product is undefined at the time when power is supplied. The states of internal circuits in the LSI are indeterminate and the states of register settings and pins are undefined at the time when power is supplied. In a finished product where the reset signal is applied to the external reset pin, the states of pins are not guaranteed from the time when power is supplied until the reset process is completed. In a similar way, the states of pins in a product that is reset by an on-chip power-on reset function are not guaranteed from the time when power is supplied until the power reaches the level at which resetting is specified.

## 3. Input of signal during power-off state

Do not input signals or an I/O pull-up power supply while the device is powered off. The current injection that results from input of such a signal or I/O pull-up power supply may cause malfunction and the abnormal current that passes in the device at this time may cause degradation of internal elements. Follow the guideline for input signal during power-off state as described in your product documentation.

## 4. Handling of unused pins

Handle unused pins in accordance with the directions given under handling of unused pins in the manual. The input pins of CMOS products are generally in the high-impedance state. In operation with an unused pin in the open-circuit state, extra electromagnetic noise is induced in the vicinity of the LSI, an associated shoot-through current flows internally, and malfunctions occur due to the false recognition of the pin state as an input signal become possible.

## 5. Clock signals

After applying a reset, only release the reset line after the operating clock signal becomes stable. When switching the clock signal during program execution, wait until the target clock signal is stabilized. When the clock signal is generated with an external resonator or from an external oscillator during a reset, ensure that the reset line is only released after full stabilization of the clock signal. Additionally, when switching to a clock signal produced with an external resonator or by an external oscillator while program execution is in progress, wait until the target clock signal is stable.

## 6. Voltage application waveform at input pin

Waveform distortion due to input noise or a reflected wave may cause malfunction. If the input of the CMOS device stays in the area between  $V_{IL}$  (Max.) and  $V_{IH}$  (Min.) due to noise, for example, the device may malfunction. Take care to prevent chattering noise from entering the device when the input level is fixed, and also in the transition period when the input level passes through the area between  $V_{IL}$  (Max.) and  $V_{IH}$  (Min.).

## 7. Prohibition of access to reserved addresses

Access to reserved addresses is prohibited. The reserved addresses are provided for possible future expansion of functions. Do not access these addresses as the correct operation of the LSI is not guaranteed.

## 8. Differences between products

Before changing from one product to another, for example to a product with a different part number, confirm that the change will not lead to problems. The characteristics of a microprocessing unit or microcontroller unit products in the same group but having a different part number might differ in terms of internal memory capacity, layout pattern, and other factors, which can affect the ranges of electrical characteristics, such as characteristic values, operating margins, immunity to noise, and amount of radiated noise. When changing to a product with a different part number, implement a system-evaluation test for the given product.

## Notice

1. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation or any other use of the circuits, software, and information in the design of your product or system. Renesas Electronics disclaims any and all liability for any losses and damages incurred by you or third parties arising from the use of these circuits, software, or information.
2. Renesas Electronics hereby expressly disclaims any warranties against and liability for infringement or any other claims involving patents, copyrights, or other intellectual property rights of third parties, by or arising from the use of Renesas Electronics products or technical information described in this document, including but not limited to, the product data, drawings, charts, programs, algorithms, and application examples.
3. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
4. You shall be responsible for determining what licenses are required from any third parties, and obtaining such licenses for the lawful import, export, manufacture, sales, utilization, distribution or other disposal of any products incorporating Renesas Electronics products, if required.
5. You shall not alter, modify, copy, or reverse engineer any Renesas Electronics product, whether in whole or in part. Renesas Electronics disclaims any and all liability for any losses or damages incurred by you or third parties arising from such alteration, modification, copying or reverse engineering.
6. Renesas Electronics products are classified according to the following two quality grades: "Standard" and "High Quality". The intended applications for each Renesas Electronics product depends on the product's quality grade, as indicated below.

"Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; industrial robots; etc.

"High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control (traffic lights); large-scale communication equipment; key financial terminal systems; safety control equipment; etc.

Unless expressly designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not intended or authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems; surgical implantations; etc.), or may cause serious property damage (space system; undersea repeaters; nuclear power control systems; aircraft control systems; key plant systems; military equipment; etc.). Renesas Electronics disclaims any and all liability for any damages or losses incurred by you or any third parties arising from the use of any Renesas Electronics product that is inconsistent with any Renesas Electronics data sheet, user's manual or other Renesas Electronics document.

7. No semiconductor product is absolutely secure. Notwithstanding any security measures or features that may be implemented in Renesas Electronics hardware or software products, Renesas Electronics shall have absolutely no liability arising out of any vulnerability or security breach, including but not limited to any unauthorized access to or use of a Renesas Electronics product or a system that uses a Renesas Electronics product. RENESAS ELECTRONICS DOES NOT WARRANT OR GUARANTEE THAT RENESAS ELECTRONICS PRODUCTS, OR ANY SYSTEMS CREATED USING RENESAS ELECTRONICS PRODUCTS WILL BE INVULNERABLE OR FREE FROM CORRUPTION, ATTACK, VIRUSES, INTERFERENCE, HACKING, DATA LOSS OR THEFT, OR OTHER SECURITY INTRUSION ("Vulnerability Issues"). RENESAS ELECTRONICS DISCLAIMS ANY AND ALL RESPONSIBILITY OR LIABILITY ARISING FROM OR RELATED TO ANY VULNERABILITY ISSUES. FURTHERMORE, TO THE EXTENT PERMITTED BY APPLICABLE LAW, RENESAS ELECTRONICS DISCLAIMS ANY AND ALL WARRANTIES, EXPRESS OR IMPLIED, WITH RESPECT TO THIS DOCUMENT AND ANY RELATED OR ACCOMPANYING SOFTWARE OR HARDWARE, INCLUDING BUT NOT LIMITED TO THE IMPLIED WARRANTIES OF MERCHANTABILITY, OR FITNESS FOR A PARTICULAR PURPOSE.
8. When using Renesas Electronics products, refer to the latest product information (data sheets, user's manuals, application notes, "General Notes for Handling and Using Semiconductor Devices" in the reliability handbook, etc.), and ensure that usage conditions are within the ranges specified by Renesas Electronics with respect to maximum ratings, operating power supply voltage range, heat dissipation characteristics, installation, etc. Renesas Electronics disclaims any and all liability for any malfunctions, failure or accident arising out of the use of Renesas Electronics products outside of such specified ranges.
9. Although Renesas Electronics endeavors to improve the quality and reliability of Renesas Electronics products, semiconductor products have specific characteristics, such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Unless designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not subject to radiation resistance design. You are responsible for implementing safety measures to guard against the possibility of bodily injury, injury or damage caused by fire, and/or danger to the public in the event of a failure or malfunction of Renesas Electronics products, such as safety design for hardware and software, including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult and impractical, you are responsible for evaluating the safety of the final products or systems manufactured by you.
10. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. You are responsible for carefully and sufficiently investigating applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive, and using Renesas Electronics products in compliance with all these applicable laws and regulations. Renesas Electronics disclaims any and all liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
11. Renesas Electronics products and technologies shall not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You shall comply with any applicable export control laws and regulations promulgated and administered by the governments of any countries asserting jurisdiction over the parties or transactions.
12. It is the responsibility of the buyer or distributor of Renesas Electronics products, or any other party who distributes, disposes of, or otherwise sells or transfers the product to a third party, to notify such third party in advance of the contents and conditions set forth in this document.
13. This document shall not be reprinted, reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.
14. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products.

(Note1) "Renesas Electronics" as used in this document means Renesas Electronics Corporation and also includes its directly or indirectly controlled subsidiaries.

(Note2) "Renesas Electronics product(s)" means any product developed or manufactured by or for Renesas Electronics.

(Rev.5.0-1 October 2020)
